I support the application to use *Bolboceras* Kirby, 1819 (July) instead of *Odonteus* Samouelle 1819 (June) because of prevailing usage of the name *Bolboceras*. The name *Odonteus* has not been used since it was first proposed except by Krell in 1990, who suggested that *Odonteus* should be used since it had priority. To do so, however, would not only destabilize the nomenclature for the often cited genus name *Bolboceras*, but it would also decrease the flow of information that is normally associated with the name *Bolboceras*. Moreover, *Bolboceras* is also the type genus for the tribe BOLBOCERATINI and subfamily BOLBOCERATINAE. It would be confusing to use *Odonteus* instead when referring to the type genus of the family-group names. The second volume of 'American Beetles', published in 2002, will be the standard for North American Coleoptera classification for the next several decades, and *Bolboceras* is used in this work (with reference to the current application to the Commission).
