*These reports have been peer reviewed by colleagues at the University of Nebraska. Any questions, suggestions, or concerns should be sent directly to the author(s).

All of the Center's research reports detailing Nebraska Rural Poll results are located on the Center's World Wide Web page at <http://cari.unl.edu/ruralpoll/>

Funding for this project was provided by the Cooperative Extension Division of the Institute for Agriculture and Natural Resources, the Agricultural Research Division of the Institute for Agriculture and Natural Resources, and the Center for Applied Rural Innovation. Additionally, considerable in-kind support and contributions were provided by a number of individuals and organizations associated with the Partnership for Rural Nebraska and the University of Nebraska Public Policy Center. A special note of appreciation is extended to the staff at the Pierce County Extension Office for the space needed to conduct this survey and to the Nebraska Library Commission for use of the laptops.

Executive Summary

Nebraska has historically had a low unemployment rate but the state's per capita income has also been below the national average. How are rural Nebraskans making a living? How many households have individuals with multiple jobs? Why do individuals hold multiple jobs? How important is agriculture to rural Nebraskans' families, communities and the state?

This report details 2,482 responses to the 2006 Nebraska Rural Poll, the eleventh annual effort to understand rural Nebraskans' perceptions. Respondents were asked a series of questions about their jobs and their perceptions about the importance of agriculture in Nebraska. For all questions, comparisons are made among different respondent subgroups, that is, comparisons by age, occupation, region, etc. Based on these analyses, some key findings emerged:

- ***Rural Nebraska households have an average of 1.3 wage earners.*** One quarter (25%) of the households have no wage earners, 24 percent have one wage earner and 48 percent have two wage earners. Of the households with at least one wage earner, the average number of wage earners is 1.7.
- ***Rural Nebraska households with at least one wage earner have an average of two jobs that contribute to the household income.*** Twenty-seven percent of the households have one job contributing to the household income and 55 percent have two jobs that make up their income.
- ***Persons living in or near smaller communities have a higher average number of jobs per household than do persons living in or near larger communities.*** Persons living in or near communities with populations less than 5,000 have an approximate average of 2.07 jobs per household, compared to an approximate average of 1.92 jobs per household for persons living in or near communities with more than 5,000 people.
- ***Fourteen percent of rural Nebraska households have an individual with more than one job.***
- ***Persons living in or near smaller communities are more likely than persons living in or near larger communities to have an individual with more than one job in their household.***
- ***Sixty percent of the households with an individual having more than one job say that more than one job is necessary to pay for living essentials.*** Thirty-seven percent say that individual has more than one job to make additional income for non-essential items.
- ***Of the households with a person having more than one job, farmers and ranchers are the occupation group most likely to say that the individual has more than one job to secure employment benefits.*** Twenty-two percent of farmers and ranchers give this reason for having a multiple job holder in their household.

- ***Twenty-seven percent of the rural Nebraska households with at least one wage earner have someone that is actively seeking a better paying job.*** Only nine percent of the households have someone that is seeking a job with more hours.
- ***Nineteen percent of rural Nebraskans currently own a farm or ranch, 11 percent own a business and five percent own both a farm or ranch as well as another type of business.***
- ***Persons living in the Southeast region are more likely than persons living in other regions of the state to own a farm or ranch.*** Twenty-five percent of the Southeast residents own a farm or ranch, compared to 16 percent of persons living in either the Panhandle or South Central regions.
- ***Most rural Nebraskans view agriculture as important to the state, their community and their family.*** The proportions believing agriculture is important to the various areas are as follows: the state's economy (90%), the state's quality of life (88%), their community's economy (88%), their community's quality of life (85%), their family's quality of life (72%) and their family's personal finances (57%).

Introduction

Nebraska's unemployment rate has been among the lowest in the nation in recent years. However, the state's per capita income has also historically been below the national average and the growth rate of this statistic in 2004 was below the national average (5.6 percent compared to 6.0 percent nationally) (Recent Nebraska Economic Trends, May 2006, Nebraska Department of Economic Development). Given this, how are rural Nebraskans piecing together their incomes? How many households have individuals with multiple jobs? Why do individuals hold multiple jobs? How important is agriculture to rural Nebraskans' families, communities and the state? This paper provides a detailed analysis of these questions.

The 2006 Nebraska Rural Poll is the eleventh annual effort to understand rural Nebraskans' perceptions. Respondents were asked a series of questions about their jobs and their perceptions of the importance of agriculture in Nebraska.

Methodology and Respondent Profile

This study is based on 2,482 responses from Nebraskans living in the 84 non-metropolitan counties in the state. A self-administered questionnaire was mailed in February and March to approximately 6,200 randomly selected households.

Metropolitan counties not included in the sample were Cass, Dakota, Dixon, Douglas, Lancaster, Sarpy, Saunders, Seward and Washington. The 14-page questionnaire included questions pertaining to well-being, community, work, new residents, immigration, and making a living. This paper reports only results from the making a

living portion of the survey.

A 40% response rate was achieved using the total design method (Dillman, 1978). The sequence of steps used follow:

1. A pre-notification letter was sent requesting participation in the study.
2. The questionnaire was mailed with an informal letter signed by the project director approximately seven days later.
3. A reminder postcard was sent to the entire sample approximately seven days after the questionnaire had been sent.
4. Those who had not yet responded within approximately 14 days of the original mailing were sent a replacement questionnaire.

The average age of respondents is 56 years. Sixty-nine percent are married (Appendix Table 1¹) and 71 percent live within the city limits of a town or village. On average, respondents have lived in Nebraska 48 years and have lived in their current community 32 years. Fifty-two percent are living in or near towns or villages with populations less than 5,000. Ninety-two percent have attained at least a high school diploma.

¹ Appendix Table 1 also includes demographic data from previous rural polls, as well as similar data based on the entire non-metropolitan population of Nebraska (using 2000 U.S. Census data). As can be seen from the table, there are some marked differences between some of the demographic variables in our sample compared to the Census data. Certainly some variance from 2000 Census data is to be expected as a result of changes that have occurred in the intervening six years. Nonetheless, we suggest the reader use caution in generalizing our data to all rural Nebraska. However, given the random sampling frame used for this survey, the acceptable percentage of responses, and the large number of respondents, we feel the data provide useful insights into opinions of rural Nebraskans on the various issues presented in this report.

Forty-nine percent of the respondents report their 2005 approximate household income from all sources, before taxes, as below \$40,000. Thirty-six percent report incomes over \$50,000.

Seventy-two percent were employed in 2005 on a full-time, part-time, or seasonal basis. Twenty-five percent are retired. Thirty-five percent of those employed reported working in a professional, technical or administrative occupation. Fourteen percent indicated they were farmers or ranchers. The employed respondents who do not work in their home or their nearest community reported having to drive an average of 31 miles, one way, to their primary job.

Household Employment

To better understand how rural Nebraskans' household income is derived, respondents were asked, "How many wage earners (persons) working part-time or more contribute to your household income - including those who are temporarily unemployed?" On average, there are 1.3 wage earners in rural Nebraska households. One quarter (25%) of the households, though, have no wage earners (Figure 1). Another 24 percent of the households have a single wage earner and almost one-half (48%) have two wage earners. Of the households with at least one wage earner, the average number of wage earners is 1.7.

The next series of questions were only asked of the households that had at least one wage earner in it. Respondents were asked how many jobs contribute to their household income. Rural Nebraskan households with at least one wage earner have an average of two jobs contributing to the household income. The answers ranged from 1 to 7.

Figure 1. Number of Wage Earners in Household

Twenty-seven percent of the households have 1 job contributing to the household income and 55 percent have two jobs that make up their household income (Figure 2).

The households have an average of 1.4 full-time jobs, 0.5 part-time jobs and 0.1 seasonal jobs. Nine percent of the households have no full-time jobs, 44 percent have one full-time job and 45 percent have two full-time jobs. Sixty-one

Figure 2. Number of Jobs Per Household

percent have no part-time jobs, 29 percent have 1 part-time job and 8 percent have two part-time jobs in the household. Most households (91%) have no seasonal employment. Eight percent of the households have one seasonal job.

The average number of wage earners and jobs per household were compared by community size, region and various individual attributes (Appendix Table 2). Households in the South Central region (see Appendix Figure 1 for the counties included in each region) have the highest average number of wage earners (1.39) as compared to the other regions. Panhandle households only have an average of 1.17 wage earners.

Households with the highest incomes have a higher average number of wage earners than do households with less income.

Households with incomes of \$60,000 or more have an average of 1.8 wage earners, compared to 0.6 wage earners in households with incomes under \$20,000.

Respondents under the age of 50 have a higher average number of wage earners per household than do older respondents. Other groups with the highest average number of wage earners per household include: males, married respondents, persons with higher education levels, manual laborers and persons who own a business.

Persons living in or near smaller communities have a higher average number of jobs per household than do persons living in or near larger communities. Persons living in or near communities with less than 5,000 population have an average of approximately 2.07 jobs per household, compared to approximately 1.92 jobs per household for persons living in or near

communities with more than 5,000 people. Other groups with the highest average jobs per household include: persons with higher household incomes, respondents under the age of 65, males, married persons and persons who own both a farm or ranch and another type of business.

Households with the highest levels of income have a higher average number of full-time jobs than do households with lower incomes. Households with incomes of \$60,000 or more have an average of 1.63 full-time jobs, compared to 0.9 full-time jobs in households with incomes less than \$20,000. Other groups with the highest average number of full-time jobs include: persons under the age of 50, married persons, respondents who own a business and the skilled laborers.

Persons living in or near smaller communities have a higher average number of part-time jobs in their household than do persons living in or near larger communities. Persons living in or near communities with populations ranging from 500 to 4,999 have an approximate average of 0.58 part-time jobs, compared to 0.45 part-time jobs for persons living in or near communities with populations of 10,000 or more. Other groups with the highest average number of part-time jobs include: lower income households, persons age 65 and older and manual laborers. Groups with the highest average number of seasonal jobs include: persons living in or near the smallest communities, persons age 30 to 39 and respondents who own both a farm or ranch and another type of business.

The number of jobs per household were subtracted from the number of wage earners in the household to determine how many

households have individuals with multiple jobs. Fourteen percent of rural Nebraska households have an individual with more than one job. This characteristic was examined by community size, region and various individual attributes (Appendix Table 3).

Persons who own both a farm or ranch and another type of business are more likely than persons not owning these to have someone in their household with multiple jobs. Thirty percent of persons owning both a farm or ranch and another type of business are in a multiple job holding household, compared to 13 percent of persons owning only a farm or ranch or persons not owning either a farm or ranch or a business.

Persons living in or near smaller communities are more likely than persons living in or near larger communities to have someone in their household with multiple jobs. Persons who have never married are more likely than the other marital groups to have a multiple job holder in their household. Twenty-one percent of persons who have never married are in a multiple job holding household, compared to 16 percent of the married respondents and two percent of the widowed respondents. Other groups most likely to be in a multiple job

holding household include: persons with household incomes over \$20,000, persons under the age of 64 and respondents with at least some college education.

The households that have a multiple job holder were next asked why that individual has more than one job. Sixty percent of these households say that more than one job is necessary to pay for living essentials and 37 percent answered “to make additional income for non-essential items” (Figure 3). Respondents were allowed to circle more than one answer.

The responses to this question were analyzed by community size, region and various individual attributes (Appendix Table 4). Only a few differences emerge. Persons with lower household incomes are more likely than persons with higher incomes to say that more than one job is necessary to pay for living essentials. Seventy-five percent of the households with a multiple job holder and household incomes under \$20,000 give this reason, compared to 44 percent of the multiple job holding households with incomes of \$60,000 or more. Other groups most likely to give this reason for having multiple jobs include: females, divorced/separated persons and persons with less education.

Farmers and ranchers are the occupation group most likely to say that the individual has more than one job to secure employment benefits. Twenty-two percent of farmers and ranchers give this reason for having multiple jobs in their household.

Respondents were next asked how many hours they and their spouse/partner (if they have one) work per week. The respondents work an average of 45.2 hours per week and their spouse/partner works an average of 38.2 hours per week. Fifty-seven percent of the respondents work over 40 hours per week. Thirty-six percent of the spouse/partners work over 40 hours per week.

The average number of hours worked per week were analyzed by community size, region and various individual attributes (Appendix Table 5). Persons living in or near the smallest communities have a higher average number of hours worked per week than do persons living in or near larger communities. Persons living in or near communities with less than 1,000 people work an average of 48 hours per week, compared to 43 hours per week for persons living in or near communities with populations of 10,000 or more.

Farmers and ranchers are the occupation group with the highest average number of hours worked per week. Farmers and ranchers work an average of 58 hours per week, compared to 38 hours per week for persons with administrative support positions.

Other groups with the highest average number of hours worked per week include: persons with the highest household incomes, persons age 40 to 49, males, both married

and divorced/separated respondents and persons owning both a farm or ranch and another type of business. The groups with the highest average number of hours worked per week for their spouse/partner include: persons with the highest household incomes, the youngest persons, females, persons who have never married and respondents owning both a farm or ranch and another type of business.

Respondents were next asked if they or their spouse or partner were doing the following items: actively seeking a better paying job or actively seeking a job with more hours. Twenty-seven percent of the households have someone that is actively seeking a better paying job (Figure 4). Only nine percent of the households have someone that is seeking a job with more hours.

The responses to this question were analyzed by community size, region and various individual attributes (Appendix Table 6). Persons who are never married are more likely than the other marital groups to be seeking a better paying job. Thirty percent of the persons who have never married are actively looking for a better paying job, compared to 11 percent of the married persons and 5 percent of the widowed persons.

Persons living in or near the larger communities are more likely than persons living in or near smaller communities to be seeking a better paying job. Sixteen percent of the persons living in or near communities with more than 5,000 persons are seeking a better paying job, compared to approximately 10 percent of the persons living in or near towns with less than 1,000 persons.

Figure 4. Percent Seeking Different Job Factors

Other groups most likely to be seeking a better paying job include: persons with lower household incomes, females, the youngest persons and persons with occupations classified as “other.”

Persons with lower household incomes are more likely than persons with higher incomes to be seeking a job with more hours. Fourteen percent of persons with incomes less than \$20,000 are seeking a job with more hours, compared to only one percent of the persons with incomes over \$60,000.

Other groups most likely to be seeking a job with more hours include: persons under the age of 65, females, persons who have never married and persons with either service occupations or occupations classified as “other.”

All of the respondents were asked if they currently own a business, farm or ranch in rural Nebraska. Nineteen percent of rural Nebraskans own a farm or ranch, 11 percent own a business and five percent own both a

farm or ranch as well as another type of business (Figure 5).

The responses to this question were analyzed by community size, region and various individual attributes (Appendix Table 7). Persons living in or near the smallest communities are more likely than persons living or near larger communities to own a farm or ranch and to own both a farm or ranch and another type of business.

Figure 5. Ownership of Farm or Ranch and Business in Rural Nebraska

Thirty-six percent of persons living in or near communities with populations less than 500 own a farm or ranch, compared to only 10 percent of persons living in or near communities with populations of 10,000 or more. And, approximately seven percent of persons living in or near communities with populations less than 5,000 own both a farm or ranch and another type of business, compared to two percent of persons living in or near communities with populations of 10,000 or more.

Persons living in the Southeast region are more likely than persons living in other regions of the state to own a farm or ranch. Twenty-five percent of the Southeast residents own a farm or ranch, compared to 16 percent of the residents of both the Panhandle and South Central regions.

Other groups most likely to own a farm or ranch include: persons over the age of 65, males, widowed respondents, persons with a high school diploma or less education and farmers/ranchers. The groups most likely to

own only a business include: persons with the highest household incomes, persons age 30 to 64, males, married persons, persons with at least some college education and respondents with sales occupations.

Perceptions of the Importance of Agriculture

Finally, respondents were asked their perceptions of the importance of agriculture in Nebraska to various areas. The majority of rural Nebraskans view agriculture as being important to the state's quality of life (88%) and economy (90%) (Figure 6). Most also believe agriculture is important to their community's quality of life (85%) and economy (88%). Almost three-quarters (72%) say agriculture is important to their family's quality of life and over one-half (57%) say it is important to their family's personal finances.

The responses to this question were analyzed by community size, region and various individual attributes (Appendix

Table 8). Some differences emerge.

Persons living in or near smaller communities are more likely than persons living in or near larger communities to view agriculture as being important to their family's quality of life, to their family's personal finances and to their community's quality of life. Sixty-six percent of persons living in or near communities with less than 500 people say agriculture is important to their family's personal finances, compared to approximately 52 percent of persons living in or near communities with populations of 5,000 or more.

Persons living in the North Central region are more likely than persons living in other regions of the state to say agriculture is important to their family's personal finances. Sixty-two percent of persons living in this region say agriculture is important to their family's finances, compared to 51 percent of persons living in the Southeast region.

Persons with the highest household incomes are more likely than persons with lower incomes to believe agriculture is important to both their community's economy and Nebraska's quality of life. Older persons are more likely than younger persons to say agriculture is important to their family's quality of life and their family's finances.

And, as expected, farmers and ranchers are more likely than persons with different occupations to say agriculture is important to both their family's quality of life and their family's personal finances. Ninety-one percent of farmers and ranchers say agriculture is important to their family's personal finances, compared to 43 percent of persons with administrative support

positions.

Conclusion

Rural Nebraska households have an average of 1.3 wage earners. Of the households with at least one wage earner, they have an average of two jobs that contribute to the household income. Fourteen percent of the rural Nebraska households have an individual with more than one job. Of those households, the majority say multiple jobs are needed to pay for living essentials. Twenty-seven percent of the rural Nebraska households with at least one wage earner have someone that is actively seeking a better paying job.

Persons living in or near the smaller communities in the state seem to have a tougher time piecing together their household incomes. These individuals have a higher average number of jobs per household and are more likely to have an individual with more than one job in their household. These individuals also have a higher average number of part-time and seasonal jobs in their household than do persons living in or near larger communities.

Most rural Nebraskans believe agriculture is important to the state, their communities and their families. The perceived importance was higher for the state and their community than for their own family, but over one-half still said that agriculture was important to their family's personal finances.
