This Article is brought to you for free and open access by the Nebraska Ornithologists' Union at DigitalCommons@University of Nebraska - Lincoln. It has been accepted for inclusion in Nebraska Bird Review by an authorized administrator of DigitalCommons@University of Nebraska - Lincoln.
On 8 August 1998 we observed a Yellow-billed Loon (Gavia adamsii) at Lake McConaughy in Keith County, Nebraska. We arrived at the pull-off on the south end of the dam at 6:25 p.m. and soon spotted a distant loon off the dam. On the basis of the yellow bill, head pattern, and large size, we concluded the bird was a Yellow-billed Loon. We studied the bird until 7:33 p.m. and again from 9:03-9:45 a.m. on 9 August. Compared to a Common Loon, this bird was huge and large-headed. The neck was very thick with an almost puffy appearance. The bird was also conspicuously dark-backed and pale-necked. The bill was long, thick, and dull yellow. The bill and head were held upturned and a slight angle. The head and neck were pale except as follows: the forehead was dark, the crown was very pale, and the nape and back of neck were light brown. There was a darker auricular patch. There was also a third dark mark on the side of the chin. The age of the bird was problematic. It was clearly not an adult because of the facial markings and pattern of the upperparts. Similarly, the very early August date suggested the bird was not a juvenile. After some study, we concluded the bird was probably in first-alternate plumage (see Appleby et al. 1986). On the basis of the bird’s behavior around boats, we strongly suspect that it had spent the entire summer at this location.

The Yellow-billed Loon remained at this location through at least 18 October 1998. Most sightings were off the south end of Kingsley Dam, although it was seen west to Arthur Bay (SJD). This is the second record of a Yellow-billed Loon in Nebraska. The first record was of an immature bird from 17-22 November 1996 at Branched Oak Lake in Lancaster County (Silcock and Jorgensen 1996). This record is particularly unusual because of the date. Yellow-billed Loons are increasingly regular in the interior U.S. with most records from November and December with a few birds
overwintering. Mlodinow and O'Brien (1996) list 7 summer records through 1996. These records are from Oregon (4), California (1), and Colorado (2). Four of these were birds that lingered through early June before departing. The other three records (1 from California and 2 from Oregon) were from July and August and likely represent "summering" birds. We thank W. Ross Silcock for helping us locate other summer reports of Yellow-billed Loons in North America.
