Supplemental Figure 1. Dry weight and seed number characteristics (per tiller) for control and RNAi wheat grown in potting mix over the growth period. Whole tiller dry weight (shoot + grain) and total vegetative matter dry weight (shoot less grain) is shown for control and RNAi lines of wheat grown in potting mix over the growth period. Also shown are mean dry weights for flag leaf, peduncle, lower leaves, stem, florets, rachis, total grain per head, individual grain weight, and number of seeds per head. DAA, days after anthesis. Values ± s.e.
