Pesticide Storage and Handling

Why should I be concerned?

Pesticides are showing up where they’re not wanted—in our drinking water. If pesticides are not handled and stored correctly around the farm, they can seep through the ground after a leak or spill, or enter a well directly during mixing and loading.

Pesticides play an important role in agriculture. They have increased farm production and enabled farmers to manage more acres with less labor. Taking voluntary action to prevent pesticide contamination of groundwater will help ensure their continued availability for responsible use by farmers.

Pesticides work by interfering with the life processes of the target pests. Pesticides can be toxic to people. If pesticides enter a water supply in large quantities—as can happen with spills or backsiphonage accidents—acute health effects (toxic effects apparent after only a short period of exposure) can range from moderate to severe, depending on the toxicity of the pesticide and the amount of exposure, and can include chemical burns, nausea, and convulsions. Contaminated groundwater used for drinking water supplies may result in chronic exposure (prolonged or repeated exposure to low doses of toxic substances), which may be hazardous to people and livestock. Long-term exposure to pesticides can cause cancer, birth defects, or organ injuries.

Some pesticides are “restricted use” and require certification before use. Following the label and guidelines found in pesticide application training will help prevent contamination due to improper use and storage.

When found in water supplies, pesticides typically occur in trace levels. The concern is primarily because of their potential to cause chronic health problems from prolonged exposure.

Your drinking water is least likely to be contaminated if you follow appropriate management procedures or dispose of wastes in any location that is off the farm site. However, proper offsite disposal practices are essential to avoid risking contamination that could affect the water supplies and health of others.

The goal of Farm*A*Syst is to help you protect the groundwater that supplies your drinking water.

How will this worksheet help me protect my drinking water?

- It will take you step-by-step through your pesticide handling, storage, and disposal practices.
- It will rank your activities according to how they might affect the groundwater that provides your drinking water supplies.
- It will provide you with easy-to-understand rankings that will help you analyze the “risk level” of your pesticide handling, storage, and disposal practices.
- It will help you determine which of your practices are reasonably safe and effective, and which practices might require modification to better protect your drinking water.
### Glossary

**Closed handling system:** A system for transferring pesticides or fertilizers directly from storage container to applicator equipment (through a hose, for example), so that humans and the environment are not inadvertently exposed to the chemicals.

**Cross-connection:** A link or channel between pipes, wells, fixtures, or tanks carrying contaminated water and those carrying potable (safe for drinking) water. Contaminated water, if at a higher pressure, can enter the potable water system.

**Micrograms per liter:** The metric weight of a substance measured in micrograms contained in one liter. It is equivalent to 1 part per billion in water measure.

**Milligrams per liter (mg/l):** The metric weight of a substance measured in milligrams contained in one liter. It is equivalent to 1 part per million in water measure.

**Parts per billion (ppb):** A measurement of concentration of one unit of material dispersed in one billion units of another material.

**Parts per million (ppm):** A measurement of concentration of one unit of material dispersed in one million units of another material.

**Pesticide:** A chemical to control, kill, or alter the activity of a pest. Examples: herbicide, insecticide, fungicide.

**Rinsate:** Rinse water from pesticide or fertilizer tank cleaning.

**Secondary containment:** A chemical storage area with impermeable floor and walls that prevent chemicals from seeping into the ground from a spill or leak.
# Pesticide Storage and Handling: Assessing the Risk of Surface Water and Groundwater Contamination

1. Use a pencil. You may want to make changes.
2. For each category listed on the left that is appropriate to your farm, read across to the right and circle the statement that best describes conditions on your farm. (Skip and leave blank any categories that don’t apply to your farm.)
3. Then look above the description you circled to find your “risk number” (1, 2, 3, or 4) and enter that number in the blank under “YOUR RISK.”
4. Allow 15-30 minutes to complete the worksheet and figure out your risk for pesticide storage and handling practices.

<table>
<thead>

</tr>
<tr>
<td>Sprayer cleaning and rinsate (rinse water) disposal</td>
<td>Sprayer washed out at farm. <em>Rinsate dumped at one point at farm or in field.</em> OR <em>Rinsate sprayed over an area less than 100 feet from well.</em></td>
<td>Sprayer washed out at farm. <em>Rinsate spread over a field area not in compliance with label.</em></td>
<td>Sprayer washed out on pad at farm. Rinsate used in next load and applied to labeled crop.</td>
<td>Sprayer washed out in field. Rinsate used in next load and applied to labeled crop. Follow all pesticide label information.</td>
<td></td>
</tr>
</tbody>
</table>

*Italic Boldface type:* Besides representing a higher-risk choice, this practice may also violate Nebraska law.

*The same area cannot be used for secondary containment for both pesticides and fertilizer handling.

***Illegal for new well construction. Existing wells must meet requirements in effect at time of construction.***
### DISPOSAL OF EXCESS PESTICIDES

<table>
<thead>
<tr>
<th>Risk Level</th>
<th>Disposal Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>HIGH RISK</td>
<td>Drain in one spot.</td>
</tr>
<tr>
<td>HIGH-MODERATE RISK</td>
<td>Apply to same plant where maximum application rate or permissible residual levels are exceeded OR spread thinly where risk to water quality is unknown.</td>
</tr>
<tr>
<td>MODERATE-LOW RISK</td>
<td>Follow all label restrictions and spread thinly where it is certain product will not present a risk to water quality.</td>
</tr>
<tr>
<td>LOW RISK</td>
<td>Follow all label restrictions and apply to same plant in another location or a different plant for which the product is also registered. Do not exceed maximum application rate and permissible residual levels.</td>
</tr>
</tbody>
</table>

### CONTAINER DISPOSAL

<table>
<thead>
<tr>
<th>Disposal Location</th>
<th>Disposal Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disposal of partially filled plastic or paper containers on farm.</td>
<td>Disposal of unriused containers or empty bags on farm. OR Unriused containers and empty bags taken to licensed landfill, municipal incinerator or dump.</td>
</tr>
<tr>
<td>Disposal of pressure rinsed or triple-rinsed containers on farm.</td>
<td>Triple-rinsed or pressure-rinsed containers returned to dealer or taken to licensed landfill. Bags returned to supplier or hazardous waste collection service. Follow all pesticide label information.</td>
</tr>
</tbody>
</table>

*Italic Boldface type*: Besides representing a higher-risk choice, this practice may also violate Nebraska law.

If you apply pesticides, you should also complete **Worksheet 15, Crop Pest Management**.

"To the extent possible, it is also recommended that application be the first alternative considered in disposing of larger quantities of pesticides, provided that use remains permissible under current federal, state, and local laws and regulations. A second alternative is to return unopened original containers to the dealer or manufacturer. When disposal by one of these methods is not feasible, contact the Solid Waste Control Division, Nebraska Department of Environmental Quality (DEQ) at 402-471-2186 for information on safe disposal."
Your groundwater vulnerability score from Worksheet 2 was __________
Note: If the surface texture, subsurface texture, or depth to groundwater used to calculate this score are not characteristic of the site conditions present for the activities/practices discussed in this worksheet, calculate a new vulnerability score for this site.

If your groundwater vulnerability score is:
- 1 to 1.4: your site has a LOW VULNERABILITY to pollution reaching groundwater.
- 1.5 to 2.4: your site has a MODERATE-LOW VULNERABILITY to pollution reaching groundwater.
- 2.5 to 3.4: your site has a HIGH-MODERATE VULNERABILITY to pollution reaching groundwater.
- 3.5 to 4.0: your site has a HIGH VULNERABILITY to pollution reaching groundwater.

Your surface water vulnerability score from Worksheet 2 was __________
Note: If the surface texture, slope toward surface water, or distance from surface water used to calculate this score are not characteristic of the site conditions present for the activities/practices discussed in this worksheet, calculate a new vulnerability score for this site.

If your surface water vulnerability score is:
- 1 to 1.4: your site has a LOW VULNERABILITY to pollution reaching surface water.
- 1.5 to 2.4: your site has a MODERATE-LOW VULNERABILITY to pollution reaching surface water.
- 2.5 to 3.4: your site has a HIGH-MODERATE VULNERABILITY to pollution reaching surface water.
- 3.5 to 4.0: your site has a HIGH VULNERABILITY to pollution reaching surface water.

Look over your worksheet scores for individual activities:

- **Low risk** practices (1’s): are ideal and should be your goal regardless of your site’s vulnerability to pollution reaching ground or surface water. Cost and other factors may make it difficult to achieve a low risk rating for all activities.

- **Moderate-low risk** practices (2’s): provide reasonable water quality protection unless your site’s vulnerability to pollution reaching ground or surface water is moderate-high or high.

- **High-moderate risk** practices (3’s): do not provide adequate protection in many circumstances, especially if your site’s vulnerability to pollution reaching ground or surface water is high or high-moderate. They may provide reasonable water quality protection if your site’s vulnerability to pollution reaching ground or surface water is low to moderate-low.

- **High risk** practices (4’s): pose a serious danger of polluting water, especially if your site’s vulnerability to pollution reaching ground or surface water is high, high-moderate, or moderate-low. Some high risk activities may not immediately threaten water quality if your site’s vulnerability to pollution reaching ground or surface water is low, but still pose a threat over time if not corrected.

Read Fact Sheet 4 Improving Pesticide Storage and Handling and consider how you might modify your farm practices to better protect your drinking water supply and other ground and surface water supplies. Some concerns you can take care of right away; others could be major or costly projects requiring planning and prioritizing before you take action.
# Summary Evaluation for Pesticide Storage and Handling Worksheet

Summarize your potential high risk activities in the following table and consider the response options you can take to reduce the potential for water quality contamination.

<table>
<thead>
<tr>
<th>High Risk Activities and Activities Impacted by Site Vulnerability</th>
<th>Response Options (Check One)</th>
<th>Taking Action</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Immediate Action Possible</td>
<td>For “immediate action possible” items, note practices and when each will occur.</td>
</tr>
<tr>
<td></td>
<td>Further Planning Required</td>
<td>For issues “requiring further planning”, note estimates, consultations, or other activities necessary and when each will occur. Establish a target date for making necessary changes.</td>
</tr>
</tbody>
</table>
Partial funding for materials, adaptation, and development was provided by the U.S. EPA, Region VII (Pollution Prevention Incentives for States and Nonpoint Source Programs) and USDA (Central Blue Valley Water Quality HUA). This project was coordinated at the Department of Biological Systems Engineering, Cooperative Extension Division, Institute of Agriculture and Natural Resources, University of Nebraska-Lincoln.

Nebraska Farm*A*Syst team members included: Robert Grisso, Extension Engineer; Richard Koelsch, Livestock Bioenvironmental Engineer; Sharon Skipton, Extension Educator; and Wayne Woldt, Extension Bioenvironmental Engineer.

This unit was modified by Robert Grisso.

Editorial assistance was provided by Nick Partsch and Sharon Skipton.

Technical reviews provided by: Larry Schulze, UNL Extension Pesticide Coordinator; Gary Buttermore, Nebraska Department of Environmental Quality; Bob Klein, UNL Extension Cropping Systems Specialist; Gary Zoubek, UNL Extension Educator; Gerald R. Bodman, UNL Biological Systems Engineering; Rob Thompson, Pickrell Cooperative, and Dave Clabaugh, Lower Big Blue Natural Resources District.

The views expressed in this publication are those of the author and do not necessarily reflect the views of either the technical reviewers or the agencies they represent.

Adapted for Nebraska from material prepared for the Wisconsin and Minnesota Farm*A*Syst programs, written by David Kammel, University of Wisconsin.

Printed on recycled paper.
