An interesting feature relates to why the snake was detected in the first place. It was a direct result of USDA/APHIS/Wildlife Services personnel tracking a radio-collared Mongoose (*Herpestes auropunctatus*) as part of a rabies study. The collar was broadcasting a mortality signal that was tracked to the fairly large gravid female *B. constrictor*, which was captured, sacrificed, and later underwent a necropsy that revealed a fully digested mongoose and its functional intact radio collar.
