Executive Summary

Agriculture has played and continues to play a critical role in Nebraska's economy. However, the industry is currently facing changes in consumer preferences for food production along with increased demands for renewable energy production and environmental goods and services. Given these changing demands, how closely are rural Nebraskans connected to agriculture? What product attributes are important to them when food shopping? What preferences do they have for government support and incentives for producing energy from various sources? How do they feel about alternative energy sources and energy conservation? This paper provides a detailed analysis of these questions.

This report details 2,797 responses to the 2010 Nebraska Rural Poll, the fifteenth annual effort to understand rural Nebraskans' perceptions. Respondents were asked a series of questions about agriculture, food and energy. For all questions, comparisons are made among different respondent subgroups, that is, comparisons by age, occupation, region, etc. Based on these analyses, some key findings emerged:

- **Most rural Nebraskans have farming or ranching history in their family.** Over one-half (52%) of rural Nebraskans are one generation or less removed from the farm or ranch and two-thirds (67%) are two generations or less removed from the farm or ranch. Another one-third of rural Nebraskans are three generations or more removed from the farm or ranch, including three in ten households that have no farming or ranching history in their family in the previous four generations.
- **Most rural Nebraskans view their economic well-being as being dependent on the agricultural industry.** Over one-half (54%) of rural Nebraskans say their economic well-being is very much dependent on the well-being of the agricultural industry. Almost one-quarter (24%) more say some of their economic well-being is tied to the agricultural industry. When combined, over three-fourths, or 78 percent feel their well-being is at least somewhat tied to agriculture.
 - ✓ *Persons living in or near smaller communities are more likely than persons living in or near larger communities to say their economic well-being is very much dependent on the well-being of the agricultural industry.* Approximately 62 percent of persons living in or near communities with less than 5,000 persons say they are very dependent on the agricultural industry, compared to 43 percent of persons living in or near communities with populations of 10,000 or more.
- **Many rural Nebraskans are involved in some segment of the agricultural industry.** Almost one-half (48%) of rural Nebraskans have some current involvement in the agricultural industry.
- **Given four competing demands on agriculture – commercial food production, community/local food systems, bioenergy and renewable energy production, and environmental goods and services - most rural Nebraskans expect them all to be important to the future of Nebraska agriculture.** Eighty-one percent of rural Nebraskans rate commercial/commodity production for global food demand as somewhat or very important for the future of Nebraska agriculture. Eighty percent rate production for community/local food systems as important, 78 percent rate

bioenergy/biofuels and renewable energy production as important to the future of Nebraska agriculture, and 77 percent rate production of environmental goods and services (habitat, water quality, ecotourism, etc.) as important.

- ***Most rural Nebraskans rate product quality/freshness, product price, and product nutritional value as the most important attributes when shopping for food.*** Other attributes, including where and how the food was produced are also important, but less so.
- ***Most rural Nebraskans would like to see government support and incentives for alternative energy sources such as wind and solar to increase.*** Eighty-six percent would either increase somewhat or greatly increase the support and incentives given for alternative energy sources with 55 percent answering greatly increase. Forty-two percent would increase the support and incentives given for nuclear power and 39 percent for traditional sources such as oil, gas and coal.
- ***Most rural Nebraskans (88%) agree that we will need to invest in alternative energy sources to meet future energy needs.*** Almost three-quarters also agree that we should invest in alternative energy now even if it is more expensive in the short term and that investment in alternative energy sources will be an economic boon to Nebraska.
- ***Most rural Nebraskans (90%) agree that their household should conserve their use of energy to decrease our dependence on foreign energy sources.*** Eighty-five percent think they should conserve energy to protect the natural environment and 80 percent say they should conserve existing energy sources for future generations. Just over one-half (54%) say their household should conserve energy to limit climate change.

Introduction

Agriculture has played and continues to play a critical role in Nebraska's economy. However, the industry is currently facing changes in consumer preferences for food production along with increased demands for renewable energy production and environmental goods and services.

Given these changing demands, how closely are rural Nebraskans connected to agriculture? What product attributes are important to them when food shopping? What preferences do they have for government support and incentives for producing energy from various sources? How do they feel about alternative energy sources and energy conservation? This paper provides a detailed analysis of these questions.

The 2010 Nebraska Rural Poll is the fifteenth annual effort to understand rural Nebraskans' perceptions. Respondents were asked a series of questions about agriculture, food and energy.

Methodology and Respondent Profile

This study is based on 2,797 responses from Nebraskans living in the 84 non-metropolitan counties in the state. A self-administered questionnaire was mailed in March and April to approximately 6,500 randomly selected households. Metropolitan counties not included in the sample were Cass, Dakota, Dixon, Douglas, Lancaster, Sarpy, Saunders, Seward and Washington. The 14-page questionnaire included questions pertaining to well-being, community, agriculture and food, energy, retail shopping, care giving and work. This paper reports only results from the agriculture, food and energy portions of the survey.

A 43% response rate was achieved using the total design method (Dillman, 1978). The sequence of steps used follow:

1. A pre-notification letter was sent requesting participation in the study.
2. The questionnaire was mailed with an informal letter signed by the project director approximately seven days later.
3. A reminder postcard was sent to the entire sample approximately seven days after the questionnaire had been sent.
4. Those who had not yet responded within approximately 14 days of the original mailing were sent a replacement questionnaire.

Appendix Table 1 shows demographic data from this year's study and previous rural polls, as well as similar data based on the entire nonmetropolitan population of Nebraska (using 2000 U.S. Census data). As can be seen from the table, there are some marked differences between some of the demographic variables in our sample compared to the Census data. Certainly some variance from 2000 Census data is to be expected as a result of changes that have occurred in the intervening ten years. Nonetheless, we suggest the reader use caution in generalizing our data to all rural Nebraska. However, given the random sampling frame used for this survey, the acceptable percentage of responses, and the large number of respondents, we feel the data provide useful insights into opinions of rural Nebraskans on the various issues presented in this report. The margin of error for this study is plus or minus two percent.

Since younger residents have typically been under-represented by survey respondents and older residents have been over-represented, weights were used to adjust the sample to match the age distribution in the nonmetropolitan counties in Nebraska (using U.S. Census figures).

The average age of respondents is 50 years. Seventy-one percent are married (Appendix Table 1) and 69 percent live within the city limits of a town or village. On average, respondents have lived in Nebraska 43 years and have lived in their current community 28 years. Fifty-two percent are living in or near towns or villages with populations less than 5,000. Ninety-five percent have attained at least a high school diploma.

Forty-one percent of the respondents report their 2009 approximate household income from all sources, before taxes, as below \$40,000. Forty-seven percent report incomes over \$50,000.

Seventy-six percent were employed in 2009 on a full-time, part-time, or seasonal basis. Eighteen percent are retired. Thirty-five percent of those employed reported working in a management, professional, or education occupation. Twelve percent indicated they were employed in agriculture.

Connection to Agriculture

Rural Nebraskans were asked a series of questions to determine their connection to agriculture. First, they were asked if they practice farming or ranching as an occupation or had in the past and if some of their family members do or had done so in the past. Most rural Nebraskans have farming or ranching history in their family. Twenty-eight percent of rural Nebraskan households currently practice farming or ranching as an occupation or have in the past (Figure 1). One-half (50%) have parents that farmed or ranched, 63 percent have grandparents that farmed or ranched and 55 percent have great-grandparents that farmed or ranched.

Figure 1. Farming/Ranching History in Family

Combining data from those that answered all parts of this question reveals that over one-half (52%) of rural Nebraskans are one generation or less removed from the farm or ranch and two-thirds (67%) are two generations or less removed from the farm or ranch (Figure 2). These Nebraskans are likely more familiar with commercial agriculture, having seen it first-hand working on the farm or ranch, growing up on the farm or ranch, or visiting the farm or ranch of their grandparents. Another one-third of rural Nebraskans are three generations or more removed from the farm or

Figure 2. Generations Removed from Farming/Ranching

ranch, including three in ten households that have no farming or ranching history in their family in the previous four generations. These rural Nebraskans are likely to be less familiar with commercial agriculture, a difference that can influence opinions and attitudes about agriculture and agricultural issues.

Persons living in or near larger communities are more likely than persons living in or near smaller communities to have no farming or ranching history in their family (Appendix Table 2). Approximately 36 percent of persons living in or near communities with populations of 5,000 or more have no farming/ranching history in their family, compared to approximately 19 percent of persons living in or near communities with less than 1,000 people.

Persons living in the Panhandle are more likely than persons living in other regions of the state to have no family farming or ranching history. Over one-third (37%) of Panhandle residents have no farming or ranching history in their family, compared to 24 percent of persons living in the North Central region (see Appendix Figure 1 for the counties included in each region). This may be explained by the fact that the Panhandle region experienced its original population growth later than did other parts of Nebraska. Along with farming and ranching, that growth was driven by nonagricultural industries, including the railroads.

Older persons are more likely than younger persons to be one generation or less removed from farming or ranching. Almost two-thirds (65%) of persons age 65 and older are one generation or less removed from farming or ranching, compared to 39 percent of persons age 19 to 29.

Next, respondents were asked to what extent their economic well-being was dependent on the well-being of the agricultural industry. Most

rural Nebraskans view their economic well-being as being dependent on the agricultural industry. Over one-half (54%) of rural Nebraskans say their economic well-being is very much dependent on the well-being of the agricultural industry (Figure 3). Almost one-quarter (24%) say some of their economic well-being is tied to the agricultural industry. When combined, over three-fourths, or 78 percent feel their well-being is at least somewhat tied to agriculture.

Economic dependence on the agricultural industry differs by community size and various individual attributes (Appendix Table 3). Persons living in or near smaller communities are more likely than persons living in or near larger communities to say their economic well-being is very much dependent on the well-being of the agricultural industry. Approximately 62 percent of persons living in or near communities with less than 5,000 persons say they are very dependent on the agricultural industry, compared to 43 percent of persons living in or near communities with populations of 10,000 or more.

The majority of households with no family farming or ranching history see their economic well-being tied to the agricultural industry.

Figure 3. Economic Dependence on the Agricultural Industry

Two-thirds (67%) of households with no family farming or ranching history say their economic well-being is at least somewhat tied to agriculture.

Older persons are more likely than younger persons to say their economic well-being is very much dependent on the agricultural industry. Approximately 59 percent of persons age 50 and older are very much dependent on the agricultural industry, compared to 43 percent of persons age 19 to 29. As noted earlier, older persons are more likely to be less generations removed from the farm or ranch which could influence their perceived reliance on the agricultural industry.

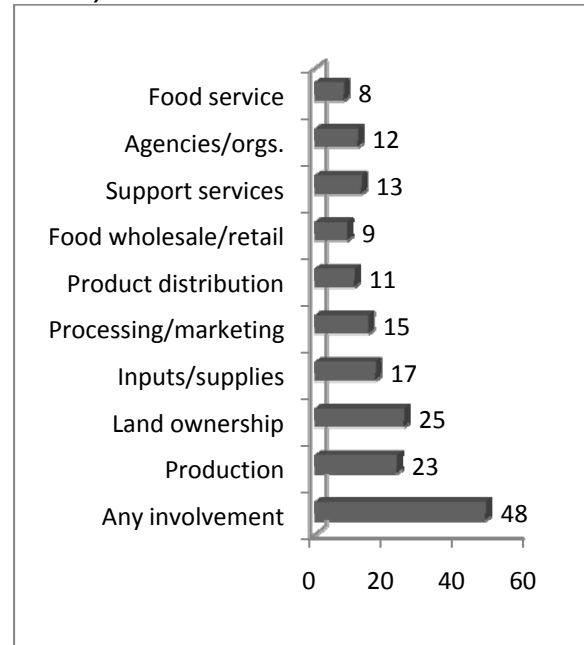

Other groups most likely to say their economic well-being is very much dependent on the well-being of the agricultural industry include: persons with higher household incomes, persons with higher education levels and persons with careers in agriculture.

To further explore how rural Nebraskans are connected with agriculture, they were asked if they are currently involved in various segments of the industry. Many rural Nebraskans are involved in some segment of the agricultural industry. Twenty-three percent of rural Nebraskans are currently involved in agricultural production and one-quarter (25%) are agricultural land owners (Figure 4).

Seventeen percent are involved in agricultural inputs/supplies and 15 percent are currently in agricultural processing/marketing. When comparing all these variables together, almost one-half (48%) of rural Nebraskans have some current involvement in the agricultural industry.

Involvement in the agricultural industry differs by community size, region and various individual attributes (Appendix Table 4). Persons living in or near smaller communities

Figure 4. Involvement in the Agricultural Industry

are more likely than persons living in or near larger communities to be involved in most segments of the agricultural industry. As an example, 42 percent of persons living in or near communities with less than 500 persons are currently involved in agricultural production. In comparison, only ten percent of persons living in or near communities with populations of 10,000 or more are currently involved in agricultural production.

Opinions about Agriculture and Food

Agriculture in Nebraska has traditionally been focused on commercial/commodity food production. However, in recent years, local food systems, bioenergy and renewable energy, and environmental goods and services have all increased in importance to society. As a result, agriculture increasingly faces new demands for these new outputs. To gauge how rural Nebraskans feel about these different demands,

respondents were asked to rate these items on the potential importance they hold for the future of Nebraska agriculture.

Most rural Nebraskans expect them all to be important to the future of Nebraska agriculture. Eighty-one percent of rural Nebraskans rate commercial/commodity production for global food demand as somewhat or very important for the future of Nebraska agriculture (Figure 5).

Eighty percent rate production for community/local food systems as important, 78 percent rate bioenergy/biofuels and renewable energy production as important to the future of Nebraska agriculture, and 77 percent rate production of environmental goods and services (habitat, water quality, ecotourism, etc.) as important.

The ratings of some of these items vary by community size, region and various individual attributes (Appendix Table 5). Residents of the Northeast region are more likely than residents of other regions in the state to think that bioenergy/biofuels and renewable energy production is important for the future of

Figure 5. Importance of Items for the Future of Nebraska Agriculture

Nebraska agriculture. Eighty-one percent of Northeast region residents rate this as important, compared to 73 percent of Panhandle residents. Residents of both the Northeast and Southeast regions are more likely than residents of other regions to rate the production of environmental goods and services as being important.

Older persons are more likely than younger persons to rate commercial/commodity production for global food demand as important. Approximately 81 percent of persons age 30 and older rate this item as being important, compared to 74 percent of persons age 19 to 29. Persons age 30 to 39 are the age group most likely to rate both production for community/local food systems and production of environmental goods and services as important for the future of Nebraska agriculture.

Persons with occupations in agriculture are *less* likely than persons with different occupations to rate production for community/local food systems as important. Persons with occupations in agriculture are also the occupation group *least* likely to rate the production of environmental goods and services as important for the future of agriculture in the state. Sixty-two percent of persons with occupations in agriculture rate this as being important, compared to 84 percent of persons with production, transportation and warehousing occupations.

Next, respondents were asked to rate the importance of a number of product attributes when shopping for food. Most rural Nebraskans rate product quality/freshness, product price, and product nutritional value as the most important attributes when shopping for food (Figure 6). These items are physical characteristics (price, nutrition labels, freshness dates) that consumers can seek out when

Figure 6. Importance of Food Product Attributes

shopping for food and making purchasing decisions or they can evaluate the attributes (quality) after purchase and make repeat purchase decisions accordingly.

Other food product attributes such as where food was produced, who produced it, or how it was produced can't be determined from the product alone, but only from information (such as labeling and process verification) presented alongside the food product. While these attributes are more difficult for consumers to assess, many of them are still important. Between 56 and 79 percent of rural Nebraskans rate various geographic and agricultural structure characteristics as important in their food purchases. These characteristics include local, Nebraska, or U.S. grown products as well as small local company or family farm produced products. While these characteristics did not rate as high in importance as the physical product characteristics of price, quality, and nutrition, they rate higher than other attributes based on production methods. Among listed production methods, 52 percent of rural

Nebraskans rate humanely-raised as an important attribute, 47 percent rate environmentally friendly as important, 44 percent rate all natural as important, and only 23 percent rate organic as important.

The ratings of some of these food attributes differ by community size, region and various individual attributes (Appendix Table 6). Product convenience was more important to lower income households, older persons, and persons with lower education levels.

Locally grown or produced was an important food attribute for lower income households, older persons, persons with lower education levels and for persons currently involved in farming or ranching. These same groups were also more likely to rate product is Nebraska grown and product is grown in the U.S. as important attributes.

Being certified organic was an important attribute for persons living in or near larger communities, lower income households, older

persons, persons with lower education levels, and persons with no farming or ranching history in their family. These same groups, with the exception of the community size group, are also most likely to rate product is identified as environmentally friendly as an important food attribute.

Persons living in or near the smallest communities, residents of both the Panhandle and North Central regions, lower income households, older persons, persons with less than a four year college degree, and persons currently involved in farming or ranching are the groups most likely to rate product's purchase supports a small family farm as being an important attribute.

The groups most likely to rate product is made by a small local company as an important attribute include: older persons; persons with a high school diploma; persons with occupations in construction, installation or maintenance; and persons currently involved in farming or ranching.

While attributes based on production methods (humanely raised, environmentally friendly, all natural, and organic) were ranked lower than other attributes, persons with no family history in farming or ranching ranked each of them higher than did other groups with a family history in farming or ranching within 3 generations or less. This supports the premise that the further consumers are removed away from agriculture, the less trust they have in conventional agriculture production systems and the more demand they have for specific production methods.

Many of these product attributes are often lumped together in discussions of local food systems. But, to explore how locally produced is specifically defined by rural Nebraskans in terms of geography, respondents were asked

the maximum distance (one-way) away from their home that they would consider food to be locally produced. One-half (50%) of rural Nebraskans define locally produced as being within 100 miles of their home (Figure 7). Just under one-third (31%) define locally produced as being within 50 miles from their home and 19 percent define it as being within 100 miles. In total, sixty percent defined locally produced in terms of distance. Of those, five in six reported locally produced as within 100 miles.

Alternatively, 40 percent define local in terms of region instead of distance. Within the 40 percent, 22 percent define locally produced as being within Nebraska, 12 percent with Nebraska and neighboring states, and 6 percent within the United States.

Figure 7. Maximum Distance Considered Locally Produced

Opinions about Energy and Conservation

Respondents were asked if they would prefer the government to increase, decrease or not

change the support and incentives it gives for producing energy from various sources. Most rural Nebraskans would like to see government support and incentives for alternative energy sources such as wind and solar to increase. Eighty-six percent would either increase somewhat or greatly increase the support and incentives given for alternative energy sources with 55 percent answering greatly increase (Figure 8). Forty-two percent would increase the support and incentives given for nuclear power and 39 percent for traditional sources such as oil, gas and coal.

Older persons are more likely than younger persons to prefer increasing the support and incentives given to produce energy from traditional sources (Appendix Table 8). Forty-seven percent of persons age 65 and older prefer increasing the support and incentives for traditional energy sources, compared to 30 percent of persons age 19 to 29.

Residents living in or near larger communities

Figure 8. Preference for Government Support and Incentives for Various Energy Sources

are more likely than persons living in or near smaller communities to prefer increasing the support and incentives given for nuclear power. Forty-six percent of persons living in or near communities with populations of 5,000 or more prefer increasing the support and incentives for nuclear power, compared to 36 percent of persons living in or near communities with less than 500 persons. Higher income households and older persons are the other groups most likely to prefer increasing the support and incentives for nuclear power.

Respondents were next given some statements about alternative energy sources and were asked to indicate the extent they agree or disagree with each. Most rural Nebraskans (88%) agree that we will need to invest in alternative energy sources to meet future energy needs (Figure 9). Almost three-quarters also agree that we should invest in alternative energy now even if it is more expensive in the short term and that investment in alternative energy sources will be an economic boon to Nebraska.

Older persons are more likely than younger persons to agree with each statement listed (Appendix Table 9). As an example, eighty-three percent of persons age 65 and older agree that investment in alternative energy sources will be an economic boon to Nebraska, compared to 56 percent of persons age 19 to 29.

Finally, respondents were given various reasons why their household should conserve their use of energy and were asked to agree or disagree with each. Most rural Nebraskans (90%) agree that their household should conserve their use of energy to decrease our dependence on foreign energy sources (Figure 10). Eighty-five percent think they should conserve energy to protect the natural environment and 80 percent say they should conserve existing energy sources for future generations. Just over

Figure 9. Opinions About Alternative Energy Sources

one-half (54%) say their household should conserve energy to limit climate change. Persons living in or near larger communities are more likely than persons living in or near smaller communities to agree that their household should conserve energy to limit climate change. Persons not currently involved in the agricultural industry are more likely than persons involved in the agricultural industry to

agree that their household should conserve energy to limit climate change. Persons living in or near larger communities are more likely than persons living in or near smaller communities to agree that their household should conserve energy to protect our natural environment. Persons with higher education levels are more likely than persons with less education to agree that they should conserve energy to protect our natural environment.

Figure 10. Reasons to Conserve Energy

Residents of the Panhandle are the regional group most likely to agree that their household should conserve energy to decrease our dependence on foreign energy sources. Other groups most likely to agree with this reasoning include older persons and persons with higher education levels.

Conclusion

Rural Nebraskans maintain a strong connection to agriculture. Most rural residents have farming or ranching history in their family and many are involved in some segment of the agricultural industry. Furthermore, most view their economic well-being as dependent on the well-being of the agricultural industry. Even the households without farming or ranching history

in their family view their economic well-being as dependent on the agricultural industry.

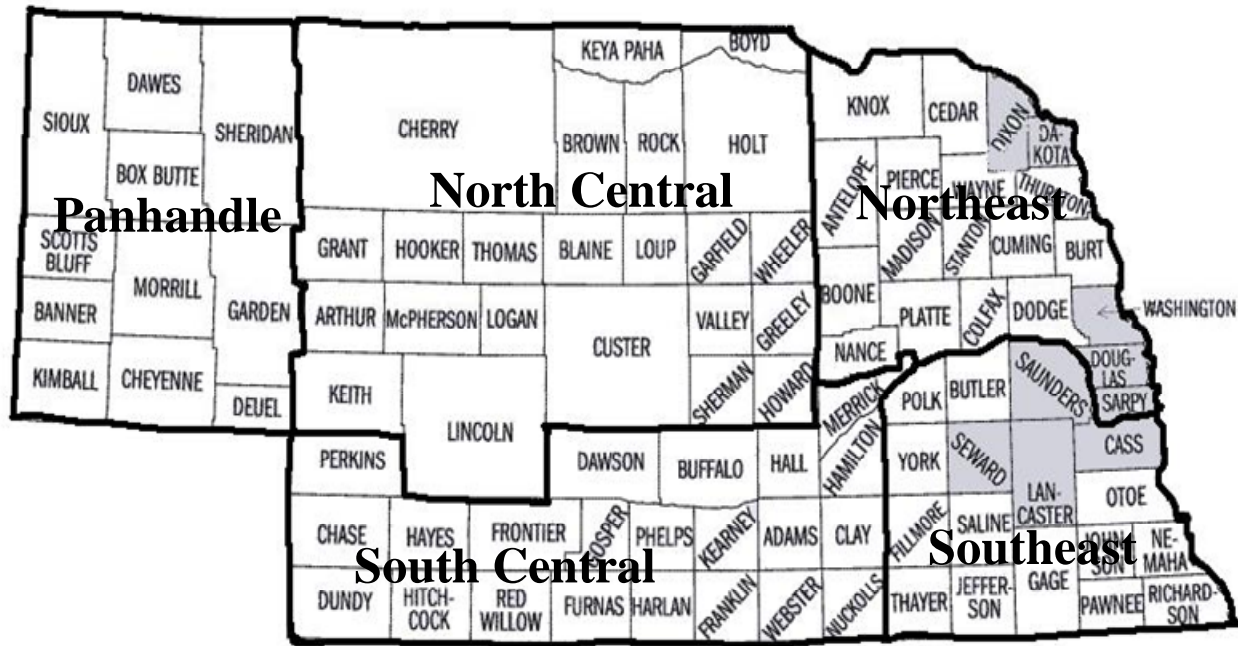

With this strong connection to the industry, most rural Nebraskans view the future of agriculture in the state as dependent on many things. Not only do they recognize the importance of commercial or commodity production for global food demand, they also view production for local food systems, bioenergy and renewable energy production and production of environmental goods and services as important for the future of agriculture.

Although rural Nebraskans view production for local food systems as important, having food be locally grown was not as highly valued as product quality/freshness, price and nutritional value when food shopping. While attributes based on production methods (humanely raised, environmentally friendly, all natural, and organic) were ranked lower than other attributes, persons with no family history in farming or ranching ranked each of them higher than did other groups with a family history in farming or ranching within 3 generations or less. This supports the premise that the further consumers are removed away from agriculture, the less trust they have in conventional agriculture production systems and the more demand they have for specific production methods.

The perceived importance of alternative energy sources is also demonstrated when most rural Nebraskans would like to see government support and incentives for alternative energy sources increased. They also believe that we will need to invest in alternative energy sources to meet future energy needs and that investment in alternative energy sources will be an economic boon to the state.

When asked about conserving energy, most rural Nebraskans believe decreasing dependence on foreign energy sources, protecting the natural environment and conserving sources for future generations are important reasons to conserve. Limiting climate change was not as highly ranked as these other reasons, but over one-half still agree that this is an important reason for their household to conserve energy.

¹ Data from the Rural Polls have been weighted by age.

² 2000 Census universe is non-metro population 20 years of age and over.

³ 2000 Census universe is total non-metro population.

⁴ 2000 Census universe is non-metro population 18 years of age and over.

⁵ 2000 Census universe is all non-metro households.

⁶ 2000 Census universe is non-metro population 15 years of age and over.
