2013

Deep Water Horizon Spill Appendix 3

Appendix Table 3-1. Benchmark exceedances for organic contaminants in water, by sample, from the Deepwater Horizon oil spill, Gulf of Mexico, 2010

[Sample dates and times are in yyyy-MM-dd hh:mm ZZZ format, where ZZZ is time zone. Paired sample: 1 indicates that sample is in the paired sample dataset, 0 indicates it is not. Primary sample: 1 indicates that sample is in the primary sample dataset, 0 indicates it is not. Benchmark values are listed in *Tables 5A* , *5B* , and *5C* .
Abbreviations: Ala., Alabama; AQL, aquatic life; BLM, Bureau of Land Management; BTEX, benzene, toluene, ethylbenzene, xylene; CDT, Central Daylight Time; dd, decimal degrees; E, estimated; EDT, Eastern Daylight Time; Fla., Florida; HH, human health; La., Louisiana; Map no., site number in *figure 1* ; Miss., Mississippi; mg/L, milligram per liter; no., number; NWR, National Wildlife Refuge; PAH, polycyclic aromatic hydrocarbon; post, post-landfall; pre, pre-landfall; sample no., sample number unique to this study; Tex., Texas; TOC, total organic carbon; $\sum TU_i$, sum of toxic units for i compounds; USEPA, U.S. Environmental Protection Agency; µg/L, microgram per liter; <, less than; –, not determined]

[1] Sum of acute or chronic benchmark toxic units for PAHs and BTEX mixtures in water; a $\sum TU_i$ value >1 indicates potential toxicity to aquatic life. BTEX compounds summed are benzene, toluene, ethylbenzene, xylene, cyclohexane, and methylcyclohexane. PAHs summed are acenaphthene, acenaphthylene, anthracene, benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[g,h,i]perylene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, fluoranthene, fluorene, indeno[1,2,3-cd]pyrene, naphthalene, phenanthrene, pyrene. Perylene and benzo(e)pyrene were excluded because data were not available. Any individual PAH or BTEX compounds that were not detected or had missing data were assumed equal to 0. For each PAH and BTEX compound, divide the concentration in µg/L by the acute or chronic potency divisor from USEPA (Table 5A), then sum the quotients for all PAH and BTEX compounds in the sample. Alkylated PAHs (which were not measured) were incorporated using USEPA multipliers (Table 5A).

[2] Four compounds with benchmarks had <50 percent recovery, so their concentrations and their contributions to benchmark exceedance could be biased low. Two of these four compounds, acenaphthylene and naphthalene, are included in the $\sum TU_i$ and other summed PAH benchmarks. For,2,4-trichlorobenzene, no benchmarks were exceeded. Benchmark exceedance could not be evaluated for N-nitrosodiphenylamine, which was never detected but whose benchmark value was below its reporting level.

[3] Summed concentration (µg/L) of the following PAH compounds, which are those included in the aquatic-life benchmark for total PAHs from Buchman (2008): Acenaphthene, Acenaphthylene, Anthracene, Fluorene, Naphthalene, Phenanthrene, 2-Methylnaphthalene, Benzo(a)anthracene, Benzo(a)pyrene, Chrysene, Dibenzo(a,h)anthracene, Fluoranthene, Pyrene

Appendix Table 3-2. Benchmark exceedances for organic contaminants in sediment, by sample, from the Deepwater Horizon oil spill, Gulf of Mexico, 2010

[Sample dates and times are in yyyy-MM-dd hh:mm ZZZ format, where ZZZ is time zone. Primary sample: 1 indicates that sample is in the primary sample dataset, 0 indicates it is not. Flag: 0 indicates that ∑ESBTU values could not be determined because TOC was not measured by the designated laboratory, shown as subscript; 1 indicates that ∑ESBTU values were calculated using TOC measured by the designated laboratory; and 2 indicates that TOC measured by the designated laboratory was below the reporting level, so one-half the reporting level was used to calculated ∑ESBTU values. Yellow shading indicates columns that contain data determined by the USGS for TOC in sediment, or that use the sediment-TOC data from USGS to compute toxic unit benchmarks; blue shading indicates columns that contain data determined by TALVT for TOC in sediment, or that use the sediment-TOC data from TALVT to compute toxic unit benchmarks. Lower and upper SVs exceeded are formatted as XXXXX.bbb, where bbb is the type of benchmark exceeded and XXXXX is the contaminant responsible for the exceedance.**Abbreviations:** AET, apparent effect threshold; Ala., Alabama; BLM, Bureau of Land Management; CDT, Central Daylight Time; dd, decimal degrees; E, estimated; EDT, Eastern Daylight Time; EqP, equilibrium-partitioning; ERL, Effects range-low; ERM, Effects range-median; $\sum ESBTU_i$, sum of equilibrium-partitioning sediment benchmark toxic units for i compounds; Fla., Florida; La., Louisiana; map no., site number in *figure 1* ; Miss., Mississippi; MW, molecular weight; no., number; NWR, National Wildlife Refuge; PAH, polycyclic aromatic hydrocarbon; PEC , probable effect concentration; PEL , probable effect level; Post, post-landfall; Pre, pre-landfall; SV, screening value; T20, concentration associated with 20 percent probability of toxicity; T50, concentration associated with 50 percent probability of toxicity; TALVT, TestAmerica Laboratory of Burlington, Vermont; TEC , threshold effect concentration; TEL , threshold effect level; Tex., Texas; TOC, total organic carbon; TOC_{talvt}, total organic carbon measured by TALVT; TOC_{usgs}, total organic carbon measured by the USGS National Water Quality Laboratory; USGS, U.S. Geological Survey; WSC, Water Science Center; %, percent;–, not determined]

[1] For each PAH compound, divide the concentration in µg/kg by the sediment-TOC content (kg-oc/kg sediment), then divide by the acute or chronic potency divisor from USEPA (*Table 5D*), and sum the quotients for all PAH compounds. Any individual PAH compounds that were not detected or had missing data were assumed equal to 0. BTEX compounds were excluded from the sum because data were not available. For some samples, akylated PAHs were not measured, so they were incorporated using USEPA multipliers (*Table 5D*). Sediment-TOC values came from the designated laboratory, either USGS or TALVT.

[2] Quality control analysis of field replicates indicates high variability (percent relative standard deviation of 22 to 47 percent) for 12 PAH compounds: benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[e]pyrene, benzo[g,h,i]perylene, benzo[k]fluoranthene, chrysene, fluoranthene, indeno[1,2,3-cd]pyrene, perylene, phenanthrene, and pyrene. Thus, the benchmark results for these PAH compounds or summed PAHs are qualified to indicate that analytical variability for PAHs in sediment is high.

Map no.	Station identifier	Site name	Site latitude (dd)	Site longitude (dd)	USGS WSC

Three PAHs showed contamination in laboratory blanks associated with two samples (is5dlabrg_01100035_01 and is5dlabrg_01100020_01), so these 3 PAHs were treated as missing data for purposes of ∑ESBTU calculation and individual benchmark exceedance. The 3 PAHs are perylene, indeno[1,2,3-cd]pyrene, and benzo[g,h,i]perylene.

[4] Sediment-TOC concentration (%) used to compute exceedance ofEqP benchmarks for individual contaminants, which are not included in ∑ESBTU for PAH mixtures. The sediment-TOC value was selected from the following prioritized list: (1) TOC value measured by USGS, if detected at ≥0.1%; (2)TOC value measured by TALVT, if detected at ≥0.1%; otherwise, (3) 0.05%, if reported as less than the detection level (<0.1%) by either (or both) USGS or TALVT.

[5] EqP benchmarks represent concentrations that are predictive of biological effects; lower SVs define concentrations below which adverse effects are not expected; and upper SVs define concentrations above which adverse effects are likely or frequent. Benchmark values are listed in *Table 5E* .

[6] Low-MW PAHs summed are: acenaphthene, acenaphthylene, anthracene, fluorene, naphthalene, phenanthrene, and 2-methylnaphthalene. High-MW PAHs summed are: pyrene, benzo(a)anthracene, benzo(a)pyrene, chrysene, dibenzo(a,h)anthracene, and fluoranthene. Summed PAHs are the sum of these low-MW and high-MW PAHs.

Appendix Table 3-3. Benchmark exceedances for trace elements in water, by sample, from the Deepwater Horizon oil spill, Gulf of Mexico, 2010

[Sample dates and times are in yyyy-MM-dd hh:mm ZZZ format, where ZZZ is time zone. Paired sample: 1 indicates that sample is in the paired sample dataset, 0 indicates it is not. Primary sample: 1 indicates that sample is in the primary sample dataset, 0 indicates it is not. Benchmark values are listed in *Table 6A.* **Abbreviations:** Ala., Alabama; AALB, acute aquatic-life benchmark; BLM, Bureau of Land Management; CALB, chronic aquatic-life benchmark; CDT, Central Daylight Time; dd, decimal degrees; EDT, Eastern Daylight Time; Fla., Florida; HHB, human health benchmark; La., Louisiana; map no., site number in *figure 1* ; mg/L, milligram per liter; Miss., Mississippi; no., number; NWR, National Wilidlife Refuge; post-postlandfall; pre, pre-landfall; sample no., sample number unique to this study; Tex., Texas; USGS, U.S. Geological Survey; WSC, Water Science Center; –, none]

Appendix Table 3-4. Benchmark exceedances for trace elements in whole sediment and national baseline comparisons for trace and major elements and nutrients in the less than the 63-micrometer sediment fraction, by sample, from the Deepwater Horizon oil spill, Gulf of Mexico, 2010

[Sample dates and times are in yyyy-MM-dd hh:mm ZZZ format, where ZZZ is time zone. Primary sample: 1 indicates that sample is in the primary sample dataset, 0 indicates it is not. Lower and upper SVs exceeded are formatted as XX.bbb, where bbb is the type of benchmark exceeded and XX is the element responsible for the exceedance. Total no. of elements determined in LT63 sediment fraction: 0 indicates that trace elements were not determined in LT63 sediment fraction, usually because there was too little LT63 sample mass to analyze. **Abbreviations:** AET, apparent effect threshold; Ala., Alabama; BLM, Bureau of Land Management; CDT, Central Daylight Time; dd, decimal degrees; EDT, Eastern Daylight Time; ERL, Effects range-low; ERM, Effects range-median; Fla., Florida; La., Louisiana; LT63, less than 63 µm; map no., site number in *Figure 1* ; Max-baseline, maximum of baseline concentration range; Miss., Mississippi; nr, not reported; NWR, National Wildlife Refuge; PEC , probable effect concentration; PEL , probable effect level; Post, post-landfall; Pre, pre-landfall; Sediment %LT63, percent of whole sediment that passes through a 63-µm sieve; SV, screening value; T20, concentration associated with 20 percent probability of toxicity; T50, concentration associated with 50 percent probability of toxicity; TC, total carbon; TEC , threshold effect concentration; TEL , threshold effect level; Tex., Texas; TOC, total organic carbon; USEPA, U.S. Environmental Protection Agency; USGS, U.S. Geological Survey; WSC, Water Science Center; µm, micrometer; <, less than; %, percent; –, not determined, often because there was too little mass of sediment LT63 to determine trace and major elements in LT63 sediment fraction.]

[1] Lower SVs define concentrations below which adverse effects are not expected, and upper SVs define concentrations above which adverse effects are likely or frequent. Chemical symbols and benchmark values are listed in *Table 6C* .

[2] Elemental symbols and national baseline values are listed in *Table 6D* . Exceedance of maximum baseline concentrations indicates enrichment above levels associated with undeveloped or agricultural areas. Quality control analysis of field replicates indicates fairly high variability (percent relative standard deviation of 20 to 30%) for Mn, Hg, Na, and Sn in the LT63 sediment fraction. All of these exceeded baseline concentrations in one or more LT63 sediment samples.
