"1980 (Twenty-Third) Fall Occurrence Report" (1981). *Nebraska Bird Review*. 211.
<http://digitalcommons.unl.edu/nebbirdrev/211>

This Article is brought to you for free and open access by the Nebraska Ornithologists' Union at DigitalCommons@University of Nebraska - Lincoln. It has been accepted for inclusion in Nebraska Bird Review by an authorized administrator of DigitalCommons@University of Nebraska - Lincoln.

1980 (TWENTY-THIRD) FALL OCCURRENCE REPORT

Two hundred eighty-one species (plus a possible Veery) are listed in this report, from 12 localities. Comparable figures for prior years are: 284 species from 11 localities in 1979, 269 from 12 in 1978, and 267 from 11 in 1977.

The information is presented in a rough west (left) to east (right) order, with locations of about the same longitude listed with the northernmost first. Two dates indicate the first and last records for the period. The symbols used are:

Jl, Au, Sp, Ot, No, and Dm for the months

P to indicate a species which is present all the year, although the same individuals may not be present during the whole year, and the numbers may vary greatly during the year.

p, in the Garden Co. column to indicate species which are present all year in the county, but not on Crescent Lake NWR.

S - to indicate a species which arrived before 1 July.

s in the Garden Co. column to indicate species which summer in the county but not on Crescent Lake NWR.

W to indicate a species which remained after 31 December (but lack of such an indicator does not necessarily mean that the species did not remain).

w in the Garden Co. column to indicate species which winter in the county but not on Crescent Lake NWR.

S - W indicates much the same thing as "P", but it is used in cases which are not the normal pattern.

x when the exact date in the month was not given.

* indicates that the birds were present at two different times in the season. The other dates are given in the comments for that locality.

The reporting locations, contributors (to the extent known), and special comments are:

Adams, Hastings, 93 species, Miss Bernice Welch, reporter.

Boone, Albion, 118 species (plus Peep), W.J. Mollhoff. A thousand Sandhill Cranes were in the flock seen 21 November.

Douglas (and Sarpy), Omaha and Bellevue, 225 species (and a possible Veery), Tanya Bray, R. G. Cortelyou, Ruth C. Green, Babs and Loren Padelford, Melba Wigg, reporters, Clyde and

Emma Johnson, Sandy Kovanda, Andy Saunders, John Upchurch, Rick Wright. On 3 August 1980 Loren Padelford observed five small white wading birds at the north end of Glenn Cunningham Lake (Site 11). This was about 8:30 AM, in bright sunlight. Three of the birds were identified as Little Blue Herons. The others were about the same size, but they had black legs, black bills, and light coloration between the eyes and the bill. One bird raised its foot out of the water far enough to show that it was a pale yellow in color. The observation was made with a 25 × 60 scope at about 100 yards. The birds were observed for several minutes before they flew off. On 31 July, at about the same place, Tanya Bray, Sandy Kovanda, and Babs Padelford watched a Buff-breasted Sandpiper for about five minutes, using binoculars and a 25 × scope. The bird was walking around the drier part of the mud flat, and then went into the grass and was not seen again. They noticed its buffy color, yellow legs, black bill, and very scaly back. It appeared to be nearly as large as the Pectoral Sandpipers that were within a few feet of it. The Yellow-throated Warbler was a regular visitor at a suet feeder in Jackie Halterman's yard. The Mississippi Kite will be the subject of a separate item in "Notes". During the Christmas Count a Thrush was seen, which the observers felt was a Veery, but because of the unlikelihood of a Veery it was shown as "Thrush Sp." (See page 33 for a photograph of the Yellow-throated Warbler.)

Wright. Mrs. Ott had a Rose-breasted x Black-headed Grosbeak from 23 August to 19 September. Bob Manning has a House Finch at his feeder in Raymond in early September. Dr. Johnson had an individual male at her feeder for three days starting 2 November. About two weeks later both House and Purple Finches arrived in numbers. Dr. Johnson saw an unusually large number and variety of hawks. The Wood Thrush fed on poke-weed berries, in her yard.

Lincoln, North Platte, 101 species, Marie Cunningham, reporter, Harold Cunningham, Margaret Morton, Ella Nielson, Wilma and Howard Wyman.

McPherson, Tryon, 80 species (plus Peep), Oona Bassett, reporter. Mrs. Bassett's records start with 1 July (since she didn't file a spring report) and end with 12 October, when she left for Arizona. Consequently, winter birds and winter dates do not appear. A Shrike sp. was recorded 1 July. The Abert's Towhee was seen in the bushes outside her picture window. She is familiar with both the Brown and Abert's Towhees from her winters in Arizona, and recognized this bird as an Abert's. She particularly noticed the black face.

Sarpy, see Douglas.

Saunders, Morse Bluff, 121 species, Rev. T.J. Hoffman, reporter. See *NBR* 48:79 for a statement of how the reporting area includes some of Dodge Co.

Scotts Bluff, Scottsbluff and North Platte NWR, 151 species (and possibly Lesser

Yellowlegs and Black-billed Cuckoo), Mrs. Lee Kenitz and C. Fred Zeilemaker, reporters, Mrs. M.A. Banghart, Lydia Bolz, Mrs. J.J. Brashear, Sherry McCoy, Mike McCoy, R.C. Rosche, Mr. and Mrs. Roy Witschy. The Artic Loon was in almost breeding plumage. The very late Baird's Sandpiper was fourteen days later than the previous state record. The ten Eared Grebes were nineteen days later than the previous state record. (As with Garden Co., the mild winter and open water helped hold some species.) The Sabine's Gull was the first for the Refuge and the sixth state record. It was an immature, and was with Franklin's and Ring-billed Gulls at Lake Minatare. The Varied Thrush was also a first for the Refuge and the eighth state record. The Calliope Hummingbird was seen at about six feet by Mrs. Banghart and Leta Neeland, several times. (They were sitting in a camper or a car). The most noticeable feature was the purple gorget feathers, which looked like whiskers to Mrs. Banghart. The bird was smaller than the Broad-tailed, which was as close as two feet to it. They thought the female was present also, but can't make a definite statement. Mrs. Kenitz saw the Scissor-tailed Flycatcher near a farm pond about four miles south of Gering. The tail caught her eye first. It did not seem as long as she remembered from when she lived in Texas, so she first thought it might be an immature. But the presence of pink made her decide that it was an adult which had lost some of its tail feathers. The bird stayed around long enough so that several other people were able to see it. She saw it daily

for five days, and then again five days later.
 Sioux, Mitchell RFD, 100 species, Helen Hughson, reporter; David Hughson, Washington, DeSoto National Wildlife Refuge, Tanya Bray, David Menke, and Babs and Loren Padelford, reporters; J. Robinson, Christopher Saunders, Bob Starr, The Blue Grosbeak was the first Refuge record, and so was the Solitary Vireo. A late hatch of Bobwhites was observed 16 September. Thirteen eggs hatched, two did not. The incubation period was twenty-one days. A Woodcock was reported 18 July, which seems to be more related to the spring reports than to those for October.
