"1981 (Twenty-Fourth) Fall Occurrence Report" (1982). *Nebraska Bird Review*. 234.
<https://digitalcommons.unl.edu/nebbirdrev/234>

This Article is brought to you for free and open access by the Nebraska Ornithologists' Union at DigitalCommons@University of Nebraska - Lincoln. It has been accepted for inclusion in Nebraska Bird Review by an authorized administrator of DigitalCommons@University of Nebraska - Lincoln.

1981 (TWENTY-FOURTH) FALL OCCURRENCE REPORT

Two hundred seventy-seven species (plus free-flying Mute Swans) are listed in this report, from 14 localities. Comparable figures for previous years are: 281 species (and a possible Veery) from 12 localities in 1980, 284 from 11 in 1979, and 269 from 12 in 1978.

The information is presented in a rough west (left) to east (right) order, with locations of about the same longitude listed with the northernmost first. Two dates indicate the first and last records for the period. The symbols used are:

Jl, Au, Sp, Ot, No, and Dm for the months

A as a column heading for observation by Rick Wright in most of Dawes Co. and Sioux Co. down to the Niobrara to about mid-August, and by Tanya Bray in Sheridan and Dawes counties 12 and 13 September

B as a column heading for observations by Babs and Loren Padelford in Gage, Jefferson, and Pawnee counties on 3, 4, and 5 July,
in column A for observations by both Rick Wright and Tanya Bray

F in column A for observations by Tanya Bray

m in Garden Co. column for species which are present in migration in the county but not on the Refuge

P to indicate a species which is present all the year, although the same individuals may not be present during the whole year, and the numbers may vary greatly during the year
p to indicate a species which is P in Garden Co. but not on the Refuge

S in column A for observations by Rick Wright, and in column B for observations by the Padelfords

S - to indicate a species which arrived before 1 July

s to indicate a species which summers in Garden Co. but not on the Refuge

S - W to indicate much the same thing as P, but where the situation is not always the case

- W to indicate a species which remained after 31 December (but the lack of such an indicator does not necessarily mean that the species did not remain)

w to indicate a species which winters in Garden Co. but not on the Refuge

x when the exact date in the month was not given

*indicates the species was present at two different times in the season. The other dates are given in the comments for that locality.

The reporting locations, contributors (to the extent known) and special comments are:
Adams, Hastings, 67 species, Miss Bernice Welch, reporter, Mrs. Elsie Helzer, Mrs. Clifford Kennedy.

Boone, Albion, 125 species, Wayne J. Mollhoff, reporter. Fall migrants showed up as (TV) tower kills earlier than he had found them before, possibly because of unfavorable weather conditions. He was surprised to find Red-breasted Nuthatch, Solitaire, and Ferruginous Hawk, and also surprised not to find a wintering Snipe, which he usually does.

Dawes, (and Sheridan and Sioux counties), 120 species, Rick Wright and Tanya Bray. See the comments under "A", above. Mr. Wright comments that apparently "pure" specimens of Lazuli Bunting were far outnumbered by introgressants, generally blackish with white belly and wing-bars. There was an invasion of "hundreds" of Red Crossbills from late June to mid-July, but they were slightly uncommon before and after. But Mrs. Bray reported that they were very abundant in Chadron State Park, 13 September, and she counted almost 300 in a flock near the lake. She found most of the potholes in Sheridan Co. to be dry and the summer residents (Long-billed Curlews, Upland Sandpipers) had left. But at one pond where there was still water she observed between 250-300 American Avocets.

Douglas (and Sarpy), Omaha and Bellevue, 209 species (and Mute Swan), Paul Bedell, Tanya Bray, R.G. Cortelyou, Ruth Green, Babs and Loren Padelford, and Melba Wigg, reporters, Betty Grennon, Gladys Johnson, Sandy Kovanda, Andy Saunders, Rick Wright. A pair of pinioned Mute Swans raised 6 young at Ginger Cove, west of Valley, and at least some of the young were free-flying for at least a while. A young male was killed when it hit a power line in southwest Omaha. Redhead was S - 7/2 also. Mr. Bedell had the Connecticut Warbler under

observation in Fontenelle Forest for about half an hour and noted the Oporornis characteristics plus the distinct complete eye ring. A male Northern (Baltimore) Oriole fed on fallen apples in Mrs. Green's yard between 8 November and 12 December. She banded it 5 December. Gage (and Jefferson and Pawnee counties), 65 species. Babs and Loren Padelford. The observation were made 3, 4, and 5 July. The Willets — 18 of them — were seen at Burchard Lake, Pawnee Co., 3 July.

Garden, Crescent Lake National Wildlife Refuge, 183 species, C. Fred Zeilemaker, reporter, Scott Foster, Monte Shaul, Dan Walsworth, Melly Zeilemaker. The Blue-gray Gnatcatcher was netted. Mr. Zeilemaker added that this is the first Nebraska report west of Lincoln.

Howard and Wilma Wyman.

McPherson, Tryon, 71 species, Oona Bassett, reporter. Mrs. Bassett left the ranch for Arizona in mid-October, so the winter birds are not adequately represented.

Pawnee, see Gage.

Pawnee, see Gage.

Sarpy, see Douglas.

Saunders, Morse Bluff, 104 species, Rev. T. A. Hoffmann, reporter. See NBR 48:79 for a statement of how the reporting area includes some of Dodge Co. Father Hoffmann commented: Piping Plover and a Least Tern were both in the area for a substantial part of the summer (Plover: Ap 18 - Jul 18; Tern: My 12 - Au 8). As in the past, they occupied the fallings from the past sand-pit activities. I never saw more than 3 Plover at a time, most often only 1. I never found any direct evidence of nesting. The Least Tern population increased steadily through the summer, reaching over two dozen on 17 July, and including juvenile birds the next day. In spite of frequent visits, I found Tern eggs in one nest on only one occasion, on 20 June. In the light of Jim Ducey's

observations (NBR 49:45), and after conversations with him, my guess is that both Plover and Tern nesting efforts on the sand tailings are subject to rather intense predation. Unlike the sandbars which he described, the tailings are not isolated from predators by the river, and I have good evidence of a flourishing racoon and opossum population in the area. The Avocet was a single bird on a sandbar in the Platte. The Magpies were seen once on 8 August (a flock of 10) and were absent until 10 October. They were observed on each of the 7 visits to the area from that date through 25 November. Observations ranged from flocks of a dozen or more to single birds. After being absent during December they returned in January.

Scotts Bluff, Scottsbluff and North Platte NWR, 156 species, Alice Kenitz and C. Fred Zeilemaker, reporters, Dorothy Adcock, Mary Ann Banghart, Lydia Bolz, Joyce Brashear, Sherry McCoy, Nora Mae Vance, Dan Walsworth, Melly Zeilemaker. The Kittiwake (which was photographed) is apparently the fourth Nebraska record (NBR 49:42).

Sheridan, see Dawes.
Sioux, see Dawes.

Thomas, Halsey National Forest, 85 species, Ruth Green, reporter. These observations were made in August, and early October and the last of that month, and include observations made on the Fall Field Day (NBR 49:65) (marked Ot 4). The "S." entries reflect observations from a June trip. The Red Crossbills were numerous on 17 August, just as they were at the Fall Field Day. With no observations after October, winter birds are not fairly represented.

Washington, DeSoto National Wildlife Refuge, 91 species, Tanya Bray and Babs and Loren Padelford, reporters, plus the Christmas Count (20 December). The observers (from the Omaha area) made about 5 trips to the Refuge; more frequent observations undoubtedly would have improved the records. A Scaup sp. was reported on the Christmas Count 20 December.
