Handling Used Oil A Guide For Small Businesses

*By Gabe Hodill, Project Assistant
Jan Hygnstrom, Project Manager
Bruce Dvorak, Extension Specialist*

Water is one of our most precious resources, particularly in Nebraska. Nebraska has more underground water than any other continental state. Protecting this water is essential since the majority of Nebraskans obtain their drinking water from underground sources. Considering that as much as 40 percent of the pollution in lakes and streams comes from used oil, the best way to protect our water may be preventing oil pollution by properly disposing of used oil.

Dumping used oil (any refined crude oil) into landfills was made illegal in Nebraska by LB1257 in 1994. A study conducted by the Coalition on Recycling in Nebraska estimates that 5 million gallons of used oil are generated each year in rural areas of Nebraska alone. Just 1 gallon of used oil can contaminate 1 million gallons of drinking water. Programs such as the Nebraska Used Oil Collection Program and methods such as oil-burning furnaces or space heaters make it easy to get rid of unwanted oil. Some companies will pay for used oil.

Used Oil Disposal Options

Purchase an oil-burning furnace

Burning your own used oil can save money by reducing the need for natural gas or electric heat as well as eliminating expensive disposal costs. This is also a reliable way to reduce your liability for used oil contamination. Before purchasing an oil-burning furnace, consider:

- *How much used oil do you generate?*

A 10,000-square-foot business will probably need more than 1,000 gallons per year. Your business should probably generate at least 50 percent of its heating needs, unless you are prepared to purchase some type of No. 2 heating oil as a supplement to the used oil.

- *What should not be mixed with the used oil?*

Gasoline, water, antifreeze, brake fluid, most solvents and toxic substances should not be burned in an oil-burning furnace.

- Installation Cost

Used oil furnaces (with accessories) usually cost around \$3,000 to \$5,000 plus a \$500 to \$1,000 installation cost, depending on the size of the furnace and chimney. If you currently use an inefficient gas furnace and have unwanted used oil, this could be a valuable option.

- Acquiring a permit

Used oil furnaces and space heaters that produce less than 0.5 million BTUs of heat normally may be used at the site of used oil generation without permits or special regulations. They may, but usually do not, require air quality permits from the Nebraska Department of Environmental Quality (NDEQ). Call (402) 471-8697 for more information. In Lancaster County and in the City of Omaha, the Lincoln-Lancaster County Health Department and the City of Omaha, respectively, are responsible for enforcing air quality regulations related to the furnaces.

- Testing used oil

A business that burns its own used oil or used oil provided solely by household do-it-yourselfers is not required to have the oil tested (see page 2).

Give oil to someone who has an oil-burning furnace

An individual (household) may give his or her used oil to another individual or business for burning in an oil furnace without testing for specification levels. Any business, including farming and ranching, that generates used oil sent directly to another business to burn for energy recovery must notify the NDEQ that they are a used oil marketer and must determine if the used oil meets specifications. This requires lab testing for each batch of oil. Most petroleum companies and any lab that tests hazardous waste can test used oil for specification. Testing can cost between \$100 and \$500. Look in the phone directory or on the Internet for "Heating Systems (or Furnaces) - Oil." If used oil does not meet specifications, it can only be burned under specific conditions. Refer to the NDEQ's Web site at <http://www.deq.state.ne.us/> under "Forms and Publications" for used oil guidance documents.

Contract pickup of used oil

Some businesses will pay a nominal price for your used oil while others will charge to take it, depending on quantity and contents. These services usually include testing of the oil, which must be treated if it is mixed with water, antifreeze or toxic substances. There may be a charge to accept the oil if it has been contaminated with these substances. A business that works with a used oil marketer is not responsible for having the oil tested, whether the used oil marketer buys the used oil, takes it for no charge or charges for the service.

Look in the phone business directory for petroleum companies or "oils-waste" or search the Internet for "used oil recycling and disposal." Although it takes less energy to make new oil from used, rather than crude oil, very few companies actually re-refine used oil. Most petroleum companies burn the oil as industrial fuel.

The Nebraska Used Oil Collection Program

The used oil collection program is available to individuals and businesses at no cost. Each collection site determines if a particular batch of oil is acceptable. Businesses that generate a small quantity of used oil

may find that the used oil collection program is the best option available. Contact Keep Nebraska Beautiful at (402) 486-4562 or <http://www.knb.org> for more information about the program. To find other sites that accept used oil, contact local auto and petroleum businesses.

What is accepted

- Spent oil from gasoline and diesel engines
- Spent refrigerant lubricating oil
- Spent lubricating oil from aircraft reciprocating and jet engines
- Spent hydraulic fluid
- Spent heat transfer fluids
- Spent transmission fluid
- Cutting oils

What is not accepted

- Spent antifreeze
- Brake fluid
- Solvent of any kind
- Used oil with water (quantity of water dependent upon vendor/marketer)

Oil-containing Materials

Oil filters

Before an oil filter is drained, it can contain 2-13 ounces of used oil. The following criteria set by the NDEQ must be met prior to landfill disposal:

1. The filters are non-terne plated filters (terne is a lead-tin alloy);
2. The filters contain no free liquids (i.e., must be crushed, or punctured and drained, and/or dismantled and drained);
3. Oil filters must be drained using one of the following hot-draining methods (oil is drained near engine operating temperature and above room temperature):
 - Puncture the filter's anti-drain back valve or the filter dome end and hot-drain;
 - Hot-drain and crush;
 - Dismantle and hot-drain; or
 - Any other equivalent hot-draining method.

Oil filters can be recycled as scrap metal if properly drained or crushed. See the NDEQ Recycling Resource Directory for a business near you or contact a company that picks up used oil for more information.

Granular oil absorbents and pads

All solid waste generation is subject to a possible hazardous waste determination. If hazardous, oil absorbents resulting from cleanup of spilled petroleum products do not require NDEQ approval before disposal. However, NDEQ does require proper hazardous waste management and disposal. For example, a small quantity generator or large quantity generator must manifest hazardous waste sorbents to a permitted facility. A conditionally exempt small quantity generator might be able to send hazardous waste sorbents to a municipal solid waste landfill if the material is allowed. To avoid generating possible

hazardous waste, use recyclable absorbents such as cellulose and diatomaceous earth. Find out more about these products via the Internet or local businesses.

Emptied oil containers

Plastic bottles that have not been completely drained of oil are not recyclable in Nebraska. To prepare them for recycling, drain them overnight on an oil bottle draining rack. Empty oil containers may be added to the trash.

Regulations regarding oil- and petroleum-related waste are in NDEQ Title 128 and Title 132 at: <http://www.deq.state.ne.us/>. For clarification call the Nebraska Department of Environmental Quality at (402) 471-4210. For other useful information on used oil, refer to Nebraska Cooperative Extension NebFact 94-196 Handling Wastes: Used Oil and Antifreeze.

Nebraska Used Oil Collection Sites (for updates, check the KNB Web page at <http://www.knb.org>)

City of Alma/Harlan County
Agri Co-op, 804 North Highway 183, Alma
