ACKNOWLEDGMENTS

The assistance of other organizations in the establishment of the International Winter Wheat Performance Nursery is acknowledged. The International Maize and Wheat Improvement Center, Mexico, D. F., gave invaluable assistance in establishing initial contacts with cooperating countries and providing guidance in details of nursery organization and procedures. Personnel of the Plant Production and Protection Division, Food and Agriculture Organization of the United Nations, assisted in nursery seed shipments to testing sites in many countries. Dr. Abdul Hafiz, FAO Near East Wheat and Barley Improvement Project, aided in nursery inspections at Near East sites.

SUMMARY

An International Winter Wheat Performance Nursery was organized by the Nebraska Agricultural Experiment Station and the Agricultural Research Service, U.S. Department of Agriculture under a contract with the Agency for International Development, U.S. Department of State. The first nursery was grown in 1969 at 23 sites in 16 countries and was comprised of 28 winter wheat varieties and 2 spring varieties. Data were reported from 21 sites.

Bezostaia with an average yield of 43 quintals per hectare was the most productive variety at 19 sites from which grain yields were reported. Blueboy, Sturdy, San Pastore and Timwin also were very productive. All of the most productive varieties possessed moderately short straw and were resistant to lodging.

There was excellent phenotypic expression of genetic differences in grain protein among varieties. Atlas 66, Purdue 4930A6-28-2-1 and NB67730, all known to possess genes for high protein from Frondoso, were the highest in average grain protein content. Lysine expressed as percent of protein was negatively correlated with protein content among the varieties tested.

Results of the First International Winter Wheat Performance Nursery

J. E. Stroike, V. A. Johnson, J. W. Schmidt and P. J. Mattern¹

The International Winter Wheat Performance Nursery (IWWPN) was organized by the Nebraska Agricultural Experiment Station and the Agricultural Research Service, U.S. Department of Agriculture, under a contract with the Agency for International Development, U.S. Department of State. There has been informal cooperation with the Food and Agriculture Organization, United Nations, and the International Maize and Wheat Improvement Center (CIMMYT), Mexico, D. F.

Specific objectives of the nursery are to:

1. Test the adaptation of winter wheat varieties under a range of latitudes, daylengths, fertility conditions, water management and disease complexes.
2. Identify superior winter varieties to serve as recipient genotypes for high protein and high lysine genes.
3. Test the degree of expression and stability of the high protein and high lysine traits in an array of environments.

Information on the adaptation and performance characteristics of winter wheat varieties is sparse. The International Spring Wheat Yield Nursery organized by CIMMYT has demonstrated that wide differences exist among spring wheats and that spring varieties of nearly universal adaptation as well as those with narrow geographic adaptation can be developed. It is not known whether universally adapted winter varieties exist or can be developed. Neither is it known which varieties among those now available are best adapted to the winter wheat production areas of the world.

High protein winter wheat experimental varieties have been developed in the United States. Research is in progress to identify varieties with genetic potential for high lysine. The full range of environments under which the high protein trait is expressed is not known nor is the impact of environment on lysine content of wheat

¹ Instructor, University of Nebraska; Research Agronomist, Agricultural Research Service, USDA; Professor and Associate Professor, University of Nebraska, Lincoln, Nebr., respectively; Cooperative investigations of the Nebraska Agricultural Experiment Station and the Agricultural Research Service, U.S. Department of Agriculture, Lincoln, Nebr., under a contract with the Agency for International Development, U.S. Department of State.

protein. Evaluation of such varieties in the IWWPN should provide useful information on breeding expectations for wheat varieties with improved nutritional value.

The IWWPN is designed to study the performance of winter wheat varieties and experimental lines from major winter wheat producing countries. Nursery sites were selected to sample the winter wheat production environments of the world. The nursery should aid in the early identification of superior winter wheat genotypes. It will serve as a vehicle for testing promising experimental lines on an international basis and it can be a continuing source of new genetic material for use by cooperators.

PROCEDURES

Varieties and experimental lines of winter wheat were nominated for nursery testing by cooperators. Seed in the amount of 1.5 kilograms of each variety was provided initially by cooperators and was increased under U.S. quarantine at Yuma, Ariz., before inclusion in the nursery.

Nursery size was restricted to 30 entries grown in 4 replications. Basic plot size was 6 rows each 2.5 meters long. Nursery seed was packaged and organized at the University of Nebraska for shipment to nursery sites. Note-recording books in duplicate were prepared and accompanied each nursery seed shipment. One completed notebook was returned from each test site to Lincoln, Nebr., following harvest.

Nursery cooperators were requested to provide performance information as follows:

Date of anthesis	Winter survival
Date ripe	Frost damage
Straw height	Disease notes
Lodging	Test weight
Shattering	Grain yield

Seed samples in the amount of 10 grams from each harvested nursery plot were returned to Lincoln, Nebr., for protein and lysine analyses.

VARIETIES

Varieties representative of important winter wheat production regions of the world were selected for the first IWWPN. In some cases these were old varieties rather than currently more popular ones. We believe that the performance of such varieties in the IWWPN will provide useful information initially. They will be

Name	C.I. or P.I. No.	Country of Origin	Pedigree

* Spring wheat

replaced by newer important varieties as space in the nursery becomes available.

The 1st IWWPN grown in 1969-70 was comprised of 30 varieties, 2 of which were spring wheats. The latter, Lerma Rojo 64 and INIA 66, were included to provide comparative spring and winter wheat performance data from those sites at which mild winter temperatures permit the seeding of spring wheats in autumn. Varieties are identified in the listing on page 5. Pedigrees, where known, are indicated.

Cooperators were requested not to substitute other varieties for designated nursery entries. Where comparisons of nursery entries with local varieties were desired, the cooperator was asked to place them at the end of each replication and number such varieties independently of the nursery series.

NURSERY SITES

Seed for planting the 1st IWWPN was sent to cooperators at 23 sites in 16 countries. These are shown in the listing that follows:

Country	Station	Latitude	Longitude	Elev. (M)
Afghanistan	Kabul	34° 33' N	69° 11' E	1803
Algeria	El-Harrach	36° N	7° E	700

Yugoslavia	Novi Sad	45° 5' N	19° 8' E	84

Yield data were reported from all nursery sites except Versailles, France; El-Harrach, Algeria; and Mead, Nebr. At Versailles severe

early lodging of the nursery rendered it useless for yield purposes. Data were not reported from El-Harrach, Algeria. Loss of stands from temperatures and heavy ice cover during the winter resulted in abandonment of the nursery at Mead, Nebr. Seed samples from harvested plots for protein and lysine analyses at the University of Nebraska Wheat Quality Laboratory were received from all test sites except El-Harrach, Algeria, and Mead, Nebr.

NURSERY MANAGEMENT

The nurseries were planted at the normal time for seeding winter wheat at each test site. Seed was provided for 6-row plots in sufficient quantity to plant approximately 180 viable seeds per row or 80 kilos per hectare.

Cooperators were requested to apply good management practices, including the use of fertilizers and control of weeds. This would permit the most rapid progress in identification of varieties that respond well to fertilizers and good management.

Cooperators were urged to protect their nurseries against bird and animal pests since such damage would nullify the nursery's experimental value.

Detailed management data and other information pertinent to the nursery are presented for each site in connection with the agronomic and yield data.

DATA SUMMARIZATION AND STATISTICAL TREATMENT

Cooperators reported nursery data as follows:

Yield of grain:—determined from the 4 central rows of each 6-row plot. Grain weights were recorded for clean grain from each plot and are reported herein in quintals per hectare (1 quintal = 100 kilograms).

Test weight:—determined from clean grain in pounds per bushel or kilograms per hectoliter depending on weighing apparatus availability.

Maturity:—Two notes were reported. Date of flowering was based on date of anther extrusion from approximately $\frac{1}{3}$ of the heads in a plot and reported as number of days from Jan. 1. Date ripe was based on date of physiological maturity and also reported as number of days from Jan. 1.

Plant height:—the average height of plants in a plot excluding awns and reported in centimeters.

Lodging:—the estimated percentage of a plot with lodged or down straw at the time of maturity.

Shattering:—the estimated percentage of grain lost from spikes in

the standing border rows of plots 2 weeks after harvest of the yield rows.

Winter survival:—the estimated percentage of plants in the center 4 rows of plots that were alive in the spring.

Frost damage:—the estimated percentage of flower sterility in plots resulting from late spring frosts.

Diseases:—severity in percent and response according to the modified Cobb scale were reported for stripe rust (*Puccinia striiformis*) West., leaf rust (*Puccinia recondita*) Rob. ex Desm., stem rust (*Puccinia graminis tritici*), Eriks. & Henn. and other diseases that were present in sufficient intensity to permit classification of variety reactions.

Cooperators were encouraged to report additional data for which notes were recorded.

An analysis of variance was computed for each trait for which data were reported from more than one replication at a nursery site. Coefficients of variation and least significant differences at the 5% level are reported for analyzable traits as a part of the individual test site data (Tables 1-22).

Data from all reporting sites are summarized individually for yield, test weight, protein, lysine and several agronomic traits in Tables 23-38.

RESULTS AND DISCUSSION

The most productive varieties averaged over 19 reporting nursery sites in 1969 were (Table 23):

	q/ha
Bezostaia	43.0
Blueboy	40.5
Sturdy	38.8
Timwin	38.2
San Pastore	37.2

All of the above varieties possess moderately short stiff straw (Table 33). At those nursery sites where they survived the winter, Lerma Rojo 64 and INIA 66 were considerably less productive than Bezostaia.

The superior yield of Bezostaia was associated with its highly consistent performance over environments. The yield rankings of varieties shown in Table 24 provide evidence. Bezostaia ranked no lower than seventh in yield at 14 sites and ranked first or second at seven sites. No other variety was so consistent.

Five American hard red winter wheat varieties and Bezostaia produced grain with highest test weight (Table 25). They are:

	kg/hl
Parker	82.2
Bezostaia	81.1
Triumph 64	80.9
Shawnee	80.8
Lancer	80.6
Scout 66	80.5

Grain protein content of varieties is summarized in Table 26. The three varieties possessing genes for high protein from Frondoso are Atlas 66, Purdue 4930A6-28-2-1 and NB67730. All produced more protein in their grain on the average than 27 other varieties in the 1st IWWPN. Cappell Desprez, Odin and Bankuti also produced grain with moderately high protein content. The American soft wheat varieties Gaines, Yorkstar and Stadler produced the lowest protein grain.

Grain yield and grain protein content frequently are negatively correlated. Therefore, protein comparisons, to be most valid, should be made among varieties of comparable yield. The protein content of several such varieties is compared in the tabulation that follows:

Variety	Grain yield (q/ha)	Protein content (%)
Atlas 66	33.4	17.5
Cappell Desprez	32.0	16.0
Odin	26.7	15.4
Felix	29.6	14.9
Winalta	32.2	13.8
Gaines	30.7	13.0
NB67730	34.8	16.4
Bankuti 1201	35.6	15.1
Triumph 64	35.6	14.7
Riley 67	36.3	14.1
Yorkstar	35.8	12.4

Atlas 66 showed a substantial protein advantage over five other varieties that yielded comparably. Similarly NB67730 produced grain with higher protein content than four other equally productive varieties.

The amino acid lysine is in shortest supply among the essential amino acids in wheat protein. The nutritional value of wheat protein, therefore, hinges upon the amount and availability of lysine in the protein. Protein quantity and lysine content of the protein tend to be inversely related in wheat. High protein wheats can be expected to have less lysine than lower protein varieties. This is evident from the lysine summary in Table 27 and in the tabulation that follows:

Variety	Protein content (%)	Lysine content (% of protein)	Lysine content (% of dry grain wt.)
Yorkstar	12.4	3.14	0.39
Gaines	13.0	3.08	0.40
Bezostaia	13.4	2.90	0.39
Fertodi 293	14.8	2.84	0.42
NB67730	16.4	2.75	0.45
Atlas 66	17.5	2.69	0.47

As protein content of varieties increases, the lysine content of the protein decreases. However, the high protein varieties produce more lysine per unit weight of dry grain than do lower protein varieties.

For breeding purposes it is important that lysine differences due to variation in quantity of protein be eliminated from lysine comparisons. We have utilized the regression of lysine on protein to adjust lysine values to a common protein level (13.5%). The adjusted lysine values for varieties in the 1st IWWPN are summarized in Table 28. The range of lysine variation following adjustment is only .24% (3.09-2.85), suggesting that there is little genetic difference for lysine among varieties in the nursery.

Differential winter survival was reported for nursery entries from nine test sites. The survival data are summarized in Table 29. Frost damage occurred at five sites (Table 30). The most severe differential killing occurred at Sapporo, Japan, where stand survivals among winter varieties ranged from only 1% for Atlas 66 and Cappell Desprez to 96% for Stadler. There was no survival for Lerma Rojo 64 or INIA 66 at Sapporo. The average survival of Atlas 66 at nine sites was 71% and for Lerma Rojo 64 46% indicating the relatively mild winter conditions at most of the sites.

San Pastore, Benhur, Triumph 64, Sturdy and Arthur in that order were the earliest to flower among the winter wheats (Table 31). The northern European varieties Odin, Felix, Cappell Desprez and Heine VII were latest flowering. Date of ripening was closely associated with date of flowering, with the earliest flowering varieties ripening first and the latest flowering varieties the last to ripen (Table 32).

Varieties with the shortest plant height on the average were as follows:

	Ht. (cm)		Ht. (cm)
Gaines	76	San Pastore	95
Sturdy	84	Blueboy	97
Timwin	89	Heine VII	98
Cappell Desprez	93	Bezostaia	99
Felix	93		

These compare with 125 and 120 cm. for Bankuti 1201 and NB67730, respectively, the tallest varieties in the nursery.

Lodging was recorded at 14 sites and was closely related to plant height (Table 34). Sturdy and Felix lodged the least on the average with the tall varieties NB67730, Scout 66 and Bankuti 1201 lodging the most severely.

Shattering was reported from five sites with the most severe at Wageningen (Table 35). Winalta and Sturdy were the most resistant to shattering on the average whereas Purdue 4930A6-28-2-1 and San Pastore were the most susceptible.

Varietal reactions to stripe rust, leaf rust and stem rust are summarized in Tables 36 to 38. The most resistant varieties to each rust appear in the listing that follows:

Stripe rust (x of 10 sites)		Leaf rust (x of 11 sites)		Stem rust (x of 9 sites)	
Variety	% Infection	Variety	% Infection	Variety	% Infection
Cappell Desprez	3.2	NB67730	7.3	Timwin	3.2
Odin	5.0	Sturdy	7.8	Arthur	3.8
Bezostaia	5.9	Benhur	8.2	Purdue 28-2-1	5.2
Fertodi 293	5.9	Bezostaia	12.5	Yung Kwang	6.8
Felix	7.1	Parker	12.5	Shawnee	7.4
Sturdy	7.3	Atlas 66	12.5	Atlas 66	9.7
Lancer	7.8	Purdue 28-2-1	12.5	Bezostaia	9.7
NB67730	8.2	Timwin	16.5	NB67730	11.0

The lowest average severities of infection to all three rusts was exhibited by Bezostaia and NB67730.

TABLES AND SUPPLEMENTAL INFORMATION FOR INDIVIDUAL NURSERY SITES

ARGENTINA

Bordenave

Cooperators: Santiago Garbini; Ernesto Florencio Godoy

Date of planting: July 16, 1968

Precipitation during cycle of test: 397 mm.

Amount of irrigation applied: None

Fertilizer used: None

General description of climatic conditions during test: Heavy frost in September. High temperature at end of November and early in December.

Disease development: *P. striiformis*—moderate intensity; *P. recondita*—moderate to low intensity; *P. graminis tritici*—low intensity.

Insect, weed or pest problems: None

Date of harvest: Dec. 11, 1968 to Jan. 8, 1969

Area harvested for yield: 3 square meters

Dates when different notes were taken: Height—Nov. 1-20, 1968; Lodging—Dec. 8, 1968 to Jan. 3, 1969; Shattering—Dec. 23, 1968 to Jan. 18, 1969; Stem Rust—Dec. 9, 1968; Stripe Rust—Nov. 4, 1968; Leaf Rust—Nov. 4, 1968; Frost Damage—Sept. 15, 1968.

Data in Table 1.

Table 1. Agronomic, grain quality and disease data for the 30 cultivars in the "1st International Winter Wheat Performance Nursery" grown at Bordenave, Argentina, 1969.

ARGENTINA

Pergamino

Cooperators: José Rath; Ernesto Florencio Godoy

Date of planting: July 8, 1968

Precipitation during cycle of test: June to December, 1968 = 584 mm. (1968 total = 911.2 mm.).

Amount of irrigation applied: None

Fertilizer used: None

General description of climatic conditions during test: Dry fall (April and May); mild winter (June, July and August); early spring (September and October) normal but November hot and dry.

Disease development: severe attack of leaf rust.

Insect, weed or pest problems: some greenbug damage.

Date of harvest: Dec. 21, 1968

Area harvested for yield: 3 square meters

Dates when different notes were taken: Leaf rust—Oct. 24, 1968.

Data in Table 2.

Table 2. Grain quality and disease data for the 30 cultivars in the "1st International Winter Wheat Performance Nursery" grown in Pergamino, Argentina, 1969.

CHILE

Temuco

Cooperators: Rodolfo Gonzalez B.; Juan Acevedo A.

Date of planting: Aug. 22, 1968

Precipitation during cycle of test: not reported

Amount of irrigation applied: None

Fertilizer used: $P_2O_5 = 200 \text{ kg./ha.}$; $N = 96 \text{ kg./ha.}$

General description of climatic conditions during test: Growing season more warm and moist than normal with drought during filling.

Disease development in general: Good development of stripe rust. Due to late planting date no records on leaf rust were obtained. No stem rust occurs at this location.

Insect, weed or pest problems: none mentioned

Date of harvest: March 27, 1969

Area harvested for yield: 3 square meters

Dates when different notes were taken: Stripe Rust—Dec. 22, 1968; height and lodging—March 15, 1969.

Data in Table 3.

UNITED STATES
North Carolina

Cooperator: C. F. Murphy

Date of planting: Oct. 23, 1968

Precipitation during cycle of test: not reported

Amount of irrigation applied: None

Fertilizer used: N = 90 kg./ha.; P = 90 kg./ha.; K = 90 kg./ha.

General description of climatic conditions during test: Very dry at planting time; good winter conditions; quite dry during early spring.

Disease development: None

Insect, weed or pest problems: None

Date of harvest: June 16, 1969

Area harvested for yield: 1.5 square meters

Dates when different notes were taken: Winter survival—April 5, 1969; plant height—May 28, 1969; lodging—May 28, 1969.

UNITED STATES
California

Cooperators: J. A. Rupert; C. O. Qualset

Date of planting: Dec. 15, 1968

Precipitation (or irrigation) during cycle of test: One irrigation during flowering.

Amount of irrigation applied: not reported

Fertilizer used: None (previous crop was beans)

General description of climatic conditions during test: Excessive winter rains in seedling stage. Hot, dry winds during and after flowering damaged late varieties.

Disease development: Heavy infection of stripe rust.

Insect, weed or pest problems: None

Date of harvest: July 10, 1969

Area harvested for yield: 3 square meters

Dates when different notes were taken: Stripe rust—May 26, 1969.

Data in Table 6.

SWEDEN

Svalöf

Cooperator: Gösta Olsson

Date of planting: Oct. 5, 1968

Precipitation during cycle of test: March 1 to July 31, 1968 = 252 mm.; Aug. 1 to Aug. 31, 1968 = 67 mm.

Amount of irrigation applied: None

Fertilizer used: N = 90 kg./ha.; P = 72 kg./ha.; K = 72 kg./ha.

General description of climatic conditions during test: More sun, higher temperature and less precipitation than normal.

Disease development: Relatively weak attack of mildew. Leaf rust very late. No stem rust or no stripe rust.

Insect, weed or pest problems: None

Date of harvest: Aug. 3–20, 1968. Dried on the field before threshing.

Area harvested for yield: 5 square meters

Dates when different notes were taken: Winter survival—April 17, 1969; mildew—July 9, 1969; plant height—July 20, 1969; lodging—July 20, 1969.

Data in Table 7.

Table 7. Agronomic, grain quality and disease data for the 30 cultivars in the "1st International Winter Wheat Performance Nursery" grown at Svalöf, Sweden, 1969.

NETHERLANDS

Wageningen

Cooperators: Ir. A. C. Zeven; J. Sneep

Date of planting: Oct. 22, 1968

Precipitation during cycle of test: 449.1 mm.

Amount of irrigation applied: None

Fertilizer used: $K_2O = 40$ kg./ha.; $P_2O_5 = 40$ kg./ha.; $N = 23$ kg./ha.

General description of climatic conditions during test: Winter severe, spring cold and wet, summer hot and dry.

Disease development: Some cultivars were attacked by stripe rust and/or mildew; other diseases were not observed.

Insect, weed or pest problems: None

Date of harvest: According to date of ripeness.

Area harvested for yield: 3.75 square meters

Dates when different notes were taken: Winter survival and frost damage—Febr. 25, 1969; stripe rust and mildew—July 15, 1969; height—June 13, 1969.

Data in Table 8.

FRANCE
Versailles

Cooperator: C. Goujan

Date of planting: Nov. 9, 1968

Precipitation during cycle of test: 502 mm.

Amount of irrigation applied: None

Fertilizer used: 100 P; 100 K; 90 N

General description of climatic conditions during test: Normal climate for Versailles.

Disease development: not reported

Insect, weed or pest problems: none mentioned

Date of harvest: July 20, 1969

Area harvested for yield: Nursery was harvested for seed only because of severe early lodging.

Dates when different notes were taken: Lodging—June 3, 1969; stripe rust—June 19, 1969; stem rust—July 8, 1969; mildew—June 19, 1969.

Data in Table 9.

ITALY

Milano

Cooperator: Bruno Rusmini

Date of planting: Nov. 1-4, 1968

Precipitation during cycle of test: 452 mm.

Amount of irrigation applied: None

Fertilizer used: N = 96 kg./ha.; P₂O = 106 kg./ha.; K₂O = 106 kg./ha.

General description of climatic conditions during test: not reported

Disease development: not reported

Insect, weed or pest problems: none mentioned

Date of harvest: 2-3 days after ripening

Area harvested for yield: 3 square meters

Dates when different notes were taken: none reported

Data in Table 10.

YUGOSLAVIA

Novi Sad

Cooperator: Slavko Borojević

Date of planting: Oct. 17, 1968

Precipitation (or irrigation) during cycle of test: 436 mm.

Amount of irrigation applied: 70 mm.

Fertilizer used: N = 125 kg./ha.; P₂O₅ = 93 kg./ha.; K₂O = 80 kg./ha.

General description of climatic conditions during test: not favorable

Disease development in general: rather severe

Insect, weed or pest problems: None

Date of harvest: July 10, 1969

Area harvested for yield: 2 square meters

Dates when different notes were taken: none reported

Data in Table 13.

ROMANIA

Fundulea

Cooperators: T. E. Muresan; Gh Ittu; N. Eustatin

Date of planting: Oct. 25, 1968

Precipitation during cycle of test: 892.3 mm. (Aug. 1, 1968 to July 31, 1969).

Amount of irrigation applied: None

Fertilizer used: $\text{NH}_4\text{NO}_3 = 48 \text{ kg./ha.}$; $\text{P}_2\text{O}_5 = 48 \text{ kg./ha.}$

General description of climatic conditions during test: Good fall conditions for emergence and growth; winter was not very cold but there was excessive snow; spring was dry but summer was excessively wet.

Disease development in general: Moderate attack of *Fusarium niveale* in the winter; heavy attack of leaf rust in late spring; moderate infections of stripe rust and moderate stem rust on late varieties.

Insect, weed or pest problems: Moderate *Eurygaster maura*.

Date of harvest: July 1-8, 1969.

Area harvested for yield: 3 square meters

Dates when different notes were taken: Winter survival—March 14, 1969; stripe rust—June 16, 1969; leaf rust—June 23, 1969; plant height—June 23, 1969; stem rust—July 1, 1969; lodging—June 30, 1969.

Data in Table 14.

TURKEY
Eskisehir

Cooperators: Rifat Gerek; Huseyin Kutluk; H. P. H. Johnson

Date of planting: Oct. 16, 1968

Precipitation during cycle of test: 469.9 mm. annual (starting Sept. 1, 1968).

Amount of irrigation applied: None

Fertilizer used: P_2O_5 (superphosphate) = 60 kg./ha.; N (ammonium sulfate) = 20 kg./ha.

General description of climatic conditions during test: Favorable fall; mild and rainy winter; cool and rainy spring; unfavorably dry and early summer.

Disease development: Moderately severe stripe rust development, practically no leaf rust or stem rust.

Insect, weed or pest problems: 2,4-D herbicide applied twice.

Date of harvest: July 15, 1969

Area harvested for yield: 3 square meters

Dates when different notes were taken: Frost damage—Febr. 1 and March 1, 1969; flowering—May 20–30, 1969; ripening—July 3–15, 1969; plant height—July 5, 1969; lodging—July 5, 1969; shattering—Aug. 1, 1969; stripe rust—May 30, 1969; leaf rust—June 10, 1969; stem rust—June 20, 1969.

Data in Table 15.

TURKEY

Ankara

Cooperators: Ahmet Demirlicakmak; H. P. H. Johnson

Date of planting: Oct. 25, 1969

Precipitation during cycle of test: not reported

Amount of irrigation applied: not reported

Fertilizer used: 6-4-0; Type: P_2O_5-N .

General description of climatic conditions during test: not reported

Disease development: not reported

Insect, weed or pest problems: none mentioned

Date of harvest: not reported

Area harvested for yield: 3 square meters

Dates when different notes were taken: none reported

Data in Table 16.

IRAQ
Sulaimaniya

Cooperators: C. L. Pan; Anwar I. Alaka

Date of planting: Nov. 11, 1968

Precipitation during cycle of test: 1172 mm.

Amount of irrigation applied: None

Fertilizer used: N = 80 kg./ha.; P₂O₅ = 40 kg./ha.

General description of climatic conditions during test: very wet winter

Disease development in general: Attacks of stripe rust, leaf rust and stem rust.

Insect, weed or pest problems: Bird injury on INIA 66 and Lerma Rojo 64 because of early flowering.

Date of harvest: June 10, 1969.

Area harvested for yield: 3 square meters

Dates when different notes were taken: Winter survival—Febr. 27, 1969; stripe rust—April 24, 1969; leaf rust—May 3, 1969; stem rust—May 8, 1969.

Data in Table 17.

Table 17. Agronomic, grain quality and disease data for the 30 cultivars in the "1st International Winter Wheat Performance Nursery" grown at Sulaimaniya, Iraq, 1969.

IRAN

Karaj

Cooperators: H. C. Thorpe; Mohammed Ali Vahabian

Date of planting: Oct. 20, 1968.

Precipitation (or irrigation) during cycle of test: Irrigated six times.

Amount of irrigation applied: not reported

Fertilizer used: N = 130 kg./ha.; P₂O₅ = 70 kg./ha.; K₂O nil; urea and ammonium phosphate used.

General description of climatic conditions during test: Very severe winter with above-average rainfall in winter and spring.

Disease development: Severe epidemic of stripe rust.

Insect, weed or pest problems: None

Date of harvest: July 8, 1969

Area harvested for yield: 3 square meters

Dates when different notes were taken: none reported

Data in Table 18.

^a Felix (MR) and Heine VII (S) were the only cultivars to show leaf rust response.

^b Local cultivar in place of Inia 66

IRAN
Kermanshah

Cooperator: H. C. Thorpe

Date of planting: Nov. 20, 1968

Precipitation during cycle of test: 828.6 mm.

Amount of irrigation applied: None

Fertilizer used: Urea (46% N) = 20 kg./ha.

General description of climatic conditions during test: Very severe winter with above-average rainfall in winter and spring.

Disease development: Infections of stripe rust and leaf rust.

Insect, weed or pest problems: Birds were a problem.

Date of harvest: June 28, 1969

Area harvested for yield: 3 square meters

Dates when different notes were taken: none reported

^a Local cultivar in place of Inia 66

AFGHANISTAN

Kabul

Cooperators: Mir Mohammed Ayub; Halim Jan; Atif Hakim; E. V. Staker

Date of planting: Sept. 18-19, 1968

Precipitation (or irrigation) during cycle of test: No precise record of precipitation kept. However, from May until harvest practically no rainfall.

Amount of irrigation applied: Most varieties received six irrigations—two in fall of 1968—but varieties Felix, Odin, Heine VII, Cappell Desprez, Blueboy, Timwin and Gaines received one extra irrigation (approximately 4 in. of water applied at each irrigation).

Fertilizer used: 120-120-50 kg./ha.—N as urea (46% N); P₂O₅ as 18% superphosphate; K₂O as potassium chloride (60% K₂O).

General description of climatic conditions during test: Average annual precipitation in Kabul is about 362 mm., very little of which falls in late spring or summer months. Summer of 1969 was very dry at Darul Aman.

Disease development: Stripe rust was most serious disease with only 5 varieties not susceptible. Four varieties were susceptible to leaf rust and 6 to stem rust.

Insect, weed or pest problems: Armyworms present but controlled with sevin. Weed, rat, gopher or bird damage not serious.

Date of harvest: June 28 to July 12, 1969

Area harvested for yield: 3 square meters

Dates when different notes were taken: Frost damage—March 9, 1969; stripe rust—May 18 and June 7, 1969; leaf rust—June 21, 1969; stem rust—June 21, 1969; irrigations—Sept. 22 and 28, 1968 and April 7, May 26, June 4, 12, and 20, 1969; sprayed with sevin May 27, 1969.

Data in Table 20.

KOREA

Suwon

Cooperators: Hyun Ok Cho; Dong Woo Ree

Date of planting: Oct. 11, 1968

Precipitation during cycle of test: 736.7 mm.

Amount of irrigation applied: None

Fertilizer used: Urea = 152 kg./ha.; double superphosphate = 90 kg./ha.; potassium chloride = 70 kg./ha.

General description of climatic conditions during test: Relatively good conditions prevailed in early part of growing season but heavy rain occurred in later part of season causing disease infection and delayed crop maturity.

Disease development in general: Severe stem rust infection was observed as compared to usual year, because of heavy rainfall this year.

Insect, weed or pest problems: Hand-weeded twice.

Date of harvest: Early July, 1969.

Area harvested for yield: 3 square meters

Dates when different notes were taken: Stem rust—June 20, 1969; lodging—June 25, 1969; plant height—June 10, 1969.

Data in Table 21.

JAPAN

Sapporo

Cooperators: T. Kumagai and H. Araki

Date of planting: Sept. 9, 1968

Precipitation during cycle of test: Sept. 9, 1968 to July 25, 1969 = 63 mm. Sept. 9, 1968 to Aug. 8, 1969 = 907.5 mm.

Amount of irrigation applied: None

Fertilizer used: NH_4SO_4 = 314 kg./ha.; superphosphate = 453 kg./ha.; KSO_4 = 40 kg./ha.

General description of climatic conditions during test: Temperature in May and June averaged below normal. Precipitation in July and August was very limited. Winterkilling was severe but survival of check variety 'Hokuei' was normal.

Disease development in general: Rusts were present but became established too late to do extensive damage. A 1 in 140 lime and sulphur compound was sprayed on June 12 and July 3 for controlling rusts. For control of winter disease, PCP was applied at a rate of 1 kg. per 1000 m² and was spread with a sprayer on Nov. 14, 1968.

Insect, weed or pest problems: Crop losses were small.

Date of harvest: July 25–Aug. 8, 1969

Area harvested for yield: 2.25 square meters

Dates when different notes were taken: none reported
