The Conservation and Survey Division of the University is the agency designated by statute to investigate and interpret the geologically related natural resources of the state, to make available to the public the results of these investigations, and to assist in the development and conservation of these resources.

The Division is authorized to enter into agreements with federal agencies to engage in cooperative surveys and investigations in the state. Publications of the Division and the cooperating agencies are available from the Conservation and Survey Division, University of Nebraska, Lincoln 68508.

Publication and price lists are furnished upon request.

Topographic Map of Eastern Nebraska Showing Location of Stops
INTRODUCTION

The areas along the lower Platte River valley and along Weeping Water valley in eastern Nebraska afford an excellent opportunity to examine strata of Cretaceous and Pennsylvanian age. It is hoped that this guidebook will be useful to those interested in a general summary of the geology in this eastern Nebraska area (see figure 1), and serve as a basis for more detailed studies in the future.

The geologic map illustrated in figure 2 shows the distribution of formations or groups ranging from the younger Cretaceous to the older Permian and Pennsylvanian. Outcropping areas of bedrock are shown in solid black and generally occur along valley sides. Most of the upland areas are mantled by variable thicknesses of Quaternary deposits.

A composite section of the outcropping Lower Permian and Upper Pennsylvanian bedrock in southeastern Nebraska is shown in figure 3. This composite is based on sections that have been measured in outcrops and quarries.

Exposures in the field-trip area range from the younger Dakota age sandstones and shales to the older limestones and shales of Pennsylvanian age. Stops 1, 2, and 3 in the lower Platte valley include exposures of Dakota Sandstone and Shale overlying Pennsylvanian deposits ranging from Toronto Limestone above to

Argentine Limestone below. Stops 4 and 5 include beds below the Argentine through the Winterset Limestone. Strata of the Topeka Formation are exposed at Stop 6 in Weeping Water valley. Further up the valley the interval below the Topeka Formation will be examined (Stop 7).

A structural contour map on the base of the Hertha Limestone (Pennsylvanian) is shown in figure 4. Elevations on the base of this limestone range from more than 1000 feet above mean sea level in Douglas and Sarpy Counties, Nebraska, to more than 300 feet below mean sea level, the deepest part of the Forest City Basin in Richardson County, Nebraska. The Table Rock Arch is a north-south trending extension of the Nemaha anticline of northeastern Kansas and is sharply faulted to the eastern edge (Humboldt and associated faults). This zone of faulting and/or steep dip extends northward across Otoe and Cass Counties along the eastern edge of the Nehawka-Richfield Arches into the surface trace of the La Platte Fault, and then northeastward into Iowa. An east-northeast to west-southwest trending fault or zone of steep dip extends from Otoe County, Nebraska, into a surface feature called the Union Fault and then into western Iowa. This fault is upthrown to the north and downthrown to the south.

ACKNOWLEDGMENTS

Special thanks are due to the Ashland Stone Company, the City Wide Rock and Excavating Company, the Hopper Brothers Quarries, and the various property owners for permission to go onto their properties.

ROAD LOG, LINCOLN TO ASHLAND, LOUISVILLE, PLATTSMOUTH,
UNION, WEEPING WATER, AND RETURN TO LINCOLN

Mileage

0.0  Leave south entrance of Holiday Inn (5250 Cornhusker Highway). Turn left (east) on Cornhusker Highway.

0.2  Junction U.S. Highways 6 and 77. Continue ahead on Highway 6.

1.7  Leave Lincoln City limits.

2.2  Junction of City route Highway 6. (STOP SIGN!) Turn left (northeast) on U.S. Highway 6.

4.7  There are irrigation wells which produce from 500 to 1000 gallons per minute from the Salt Creek valley alluvium here and for the next six miles down-valley. The groundwater in the valley alluvium increases in salt content near Lincoln and is very salty farther to the west where the alluvium is channeled into the lower sandstones of the Dakota Group which do not outcrop but are overlapped by the upper sandstone.

5.4  Underpass Interstate Highway 80.

7.6-8.3  Town of Waverly, Nebraska.

11.8  Entrance to Greenwood LP-gas storage facility of Mid-America Pipeline Company. A cavern was excavated at this location between the depths of 325 and 350 feet in the Bonner Springs Shale and the upper two-thirds of the Wyandotte Limestone (see figure 3). The plan of the cavern resembles a city street with blocks. Excavation was by the room-and-pillar method with room widths of 20 feet separated by large pillars. Storage capacity of 400,000 barrels of LP-gas is provided. A generalized correlation of the rocks penetrated in core drilling at the site is as follows:

Location: SE-SE sec. 1 and NE-NE sec. 12, T. 11 N., R. 8 E., Lancaster County.

Elevation of Land Surface: 1120 feet above mean sea level.

Depth, in feet

(Total Depth)

Mileage

11.9  Leave Lancaster County and enter Cass County (figure 1).
12.9  Enter Greenwood, Nebraska.
13.8  Leave Greenwood, Nebraska.
18.2  Leave Cass County and enter Saunders County (figure 1).
19.7  Outcrop of Dakota Sandstone in roadcut on right (southeast). The lower part of the Oread Limestone Formation (Pennsylvanian) is exposed at lower elevations in this vicinity.
20.5  Junction with State Highway 63 and entrance to Ashland, Nebraska, to the west. Continue ahead on U.S. Highway 6.
20.7  Lincoln Water Treatment and Pumping Plant on right (southeast). Sandstone of the upper part of the Dakota Group of Cretaceous age forms the bedrock of Lincoln. Formerly, Lincoln's water supply came entirely from wells drilled into these sandstones within the city limits, but overdevelopment resulted in reduction of quality as more mineralized water came into the reservoir from the west. Therefore, Lincoln developed a well field near Ashland (25
Mileage

miles to the northeast) and water is transported to Lincoln through two large pipe lines with the local wells being used largely for standby during periods of peak demand. Also, experiments are underway to evaluate the possibilities of recharging the local sandstone reservoir with water from Ashland during periods of low demand, when pipe-line capacity is not fully needed, and withdrawing more water from the local reservoir during periods of peak demand. This will eliminate the need for additional pipe-line facilities for a long period of time. A location map of the Lincoln Water Supply Ashland well field is shown in figure 5.

21.2 STOP NO. 1. Entrance to Ashland Stone Company Quarry on right (southeast). The stratigraphic sequence exposed is illustrated in figure 6. Much of the limestone used for concrete aggregate in Interstate 80 construction was produced from the Cass Limestone in this quarry.
Figure 5  Map of Lincoln Well Field near Ashland, showing location of Stop 1.
STOP 1: ASHLAND STONE COMPANY QUARRY

Location: Approximately 3/8 mile northeast of Lincoln Water Treatment Plant in Ashland, Cass County, Nebraska (NW NW sec. 6-T12N-R10E)

Elevation: Top of Cass Formation (+1066 ft. MSL)

Mileage

21.6 Burlington Northern Railroad overpass.

21.9 Bridge across Salt Creek.

23.0 Bridge across Platte River. Leave Saunders County and enter Sarpy County (figure 1).

23.4 Junction with county road. Turn right (east) and proceed along county road.

23.6 Linoma Beach on right (south). This is a privately-owned recreational area developed in abandoned sand and gravel pits.

24.9 Overpass across Interstate Highway 80.

25.0 Turn right (south) on gravel road.

25.4 This is the most northerly exposure of the Dakota Sandstone in this part of Sarpy County.

26.1-26.3 Dakota Sandstone outcrops on left mantled by Peoria Loess (Pleistocene).

27.1 STOP NO. 2. Rock Lake Quarry on left (north). The Pennsylvanian bedrock exposures at this quarry are illustrated in figure 7. This stop will also give an opportunity to examine the Dakota Sandstone.
STOP 2: ROCK LAKE QUARRY

Location: Approximately 1 1/2 miles west and 1/2 mile north of Gretna State Fish Hatchery, Sarpy County, Nebraska (C SL NE SW sec. 3-T12N-R10E)

Elevation: Top of Stoner Limestone Member (+1067.5 ft. MSL)

Figure 12
Mileage

34.1 Kiewit Quarry and Mine on left (north). The succession of limestones and shales exposed here is essentially the same as exposed at the Derby Quarry (mileage 33.7). The quarry and mine in the Argentine Limestone have been abandoned for a number of years. This was the first limestone mining operation in this part of the state. The abandoned mine is a haven for bats and is reported to be the largest concentration north of Carlsbad, New Mexico.

34.7 CAUTION! Cross Rock Island railroad tracks.

34.9 CAUTION! Cross Missouri Pacific railroad tracks and stop at junction of State Highway 31 and Nebraska State Highway 50. Site of Meadow Station. Turn left (north) along Highway 50.

35.2 CAUTION! Cross Missouri Pacific railroad tracks.

35.3 CAUTION! Cross Rock Island railroad double tracks.

35.6 Outcrop of Pennsylvanian Limestone on left (northwest).

37.1 Abandoned sand pit used for asphaltic concrete to left (west).

39.7 Junction of Highway 50 and main street of Springfield, Nebraska. Turn right (east) and continue eastward through Springfield.
Mileage

39.9 CAUTION! Missouri Pacific railroad tracks. Note building on left (north) constructed of Dakota Sandstone blocks.

40.9 Leave asphalt, enter gravel road. Continue ahead (eastward).

41.8 Turn right (south).

42.0 Turn left (east).

42.4 CAUTION! Cross Rock Island railroad tracks. Turn right (south).

43.0 STOP NO. 4. East end of Richfield P.W.A. Quarry (Schmid Property operated by City Wide Rock & Excavation Company). The bedrock sequence exposed in this quarry is illustrated in figure 13. A mine in the Winterset Limestone was operated at this locality many years ago.

Richfield Quarry

Retrace route to north and continue ahead (north).

45.9 Turn right (east).

47.1 Turn left (north).

47.4 Turn right (east).

51.0 Turn left (north).
STOP 4: RICHFIELD P.W.A. QUARRY
Location: Approximately 2 3/4 miles south of Richfield, Sarpy County, Nebraska (C 5 1/2 N ½ sec. 28-T13N-R12E)
Elevation: Top of Winterset Limestone Member (+1029 ft. MSL)

1 Ls, bluish-gray; crinoids 1.0

Figure 13
Mileage

51.2  Turn right (east).

51.7  Stop sign. Turn right (south) along secondary road (36th Street). A pipeline has been installed along this road to transport water from the Platte River valley into Omaha.

53.4  Turn right (west) along gravel road.

54.0  STOP NO. 5. City Wide Rock and Excavation Company Quarry (Iske Property). The rocks exposed at this site are illustrated in figure 14. This locality is of special interest because three separate tills of Pleistocene age are exposed above the Winterset Limestone of Pennsylvanian age.

City Wide Rock Quarry

Retrace route east to intersection with 36th Street.

54.2  Road crosses the La Platte Fault, along the east side of the Nehawka-Richfield Arch, with a displacement of about 23 feet. (See figure 4).

54.3  Entrance to Welsh Stone Company Quarry on the left (north). Glacial striations with a north 25-degree east trend have been observed on the upper surface of the Winterset Limestone in this quarry. On the right (south), a water treatment and pumping plant in connection with the new well field of Metropolitan Utilities District of Omaha has been constructed. It is anticipated that a peak of 60 million gallons of water per day will be developed for a supplement
STOP 5: CITY WIDE ROCK & EXCAVATION COMPANY QUARRY
Location: Approximately 2 3/4 miles west of La Platte, Sarpy County, Nebraska (SW SW sec. 20 & NW NE NW sec. 29-T13N-R13E)
Elevation: Top of Stark Shale Member (+995 ft. MSL)

Mileage

to the present Omaha supply from Missouri River stream-flow sources.

Welsh Stone Quarry

Glacial striations on top of the Winterset Limestone

54.6
Road to left (north) extends into 36th Street in Omaha.

55.2
Abandoned sand and gravel operations of the Lyman-Richey Sand and Gravel Company on the right (south). These were wet-pit operations in the Platte River valley alluvium with 50 feet or more of sands and gravels available below groundwater levels.

55.5
Secondary road and Dyson Hollow to left (north). The valley-side exposures in this vicinity are illustrated in figure 15. Note that the Lansing Limestones, exposed well above valley level here, are close to valley level at mileage 52.6, indicating a structural rise of more than 30 feet. The stratigraphic position of the Pennsylvanian outcrops in the Lower Platte River valley are shown in figure 3.

55.6
Entrance to Sorensen Quarry operated by Central Quarries Incorporated. The bedrock exposed in the quarry and eastward in this vicinity is shown in figure 16.

Mileage

86.9 CAUTION! Missouri Pacific railroad tracks.

89.7 Junction with Nebraska Highway 50. Turn right (north) on Highway 50.

93.2 Outcrop of Lower Topeka and Upper Deer Creek Limestones in road cut on left (west); entrance to Hopper Brothers Quarry on right (east) where the Upper Oread Limestone is being quarried.

93.5 Cross Weeping Water Creek. Turn right (east) on Highway 50A just beyond Creek.

94.1 Entrance to Kerford Limestone Company Quarry on left (north). This quarry used to produce from the Ervine Creek and associated limestones of the Shawnee Group at the higher level but is now producing from a mine in the Oread Limestone just below valley level.

94.7 Leave Highway 50A, turn left (north) into Hopper Brothers Quarry (Clements Quarry).

94.8 CAUTION! Cross Missouri Pacific railroad tracks.

94.9 STOP NO. 7. Clements Quarry, operated by Hopper Brothers Quarries in the Plattsmouth Kerford Limestone near and below valley level. This was the first mine developed in Weeping Water Creek Valley and is a favorable site because the Plattsmouth-Kerford Limestone interval is thicker and of better quality than in areas of exposure down-valley. This rock has been used for road material and concrete aggregate. The stratigraphic position of the exposed rocks is shown in figure 3 and the details of the section exposed are illustrated in figure 18.
STOP 7: HOPPER BROS. QUARRY and ADJACENT ROADCUT
Location: Approximately 650 feet north of State Highway Spur 50A, 1\(\frac{1}{4}\) miles west of Weeping Water, Cass County, Nebraska. (C SE SE sec. 34, & G WL SW SW sec. 35-T11N-R11E)
Elevation: Top of Rock Bluff Limestone Member (+1159 ft. MSL)

Clements Quarry

Mileage

96.2  Retrace route to Highway 50A and Highway 50.  
       Junction with Highway 50.  Directly to the west is 
       the plant of the Sargent Calcium Company Quarry and 
       Mine where limestone is fine-ground for use in feeds 
       as mineral filler.  Turn left (south).

100.2  Stop Sign; junction Nebraska Highway 50 and U. S. 
       Highway 34; turn right (west) on Highway 34.

101.9  Abandoned missile site on right (north).  The 
       correlation of the materials drilled and excavated 
       at this site is as follows:

Location:  NW-SW-SE sec. 20, T. 10 N., R. 11 E., Cass County. 
Elevation of Land Surface:  1303 feet above mean sea level.

Mileage

106.4 Road intersection. Access road to Elmwood (Nebraska Highway 1) to right (north).

110.4 Road right (north) to abandoned missile site. A study of the records of drilling and excavation at this site indicates a correlation of materials drilled as follows:

Quaternary (Pleistocene), 124 feet:
- Peoria Loess (Medial Wisconsinan)........... 0 - 19
- Gilman Canyon Formation (Early Wisconsinan)................ 19 - 23
- Loveland Formation (Illinoian)...................... 23 - 46
- Glacial Till (Kansan)............................. 46 - 98
- Pro-Kansan Sand................................ 98 - 103
- Glacial Till (Nebraskan)........................... 103 - 124

Pennsylvanian (Virgil Series), 102 feet:
- Wabaunsee Group, 102 feet:
  - Willard-Langdon Shale.......................... 124 - 160
  - Emporia Limestone.............................. 160 - 170
  - Auburn Shale.................................. 170 - 202
  - Wakarusa Limestone............................ 202 - 208
  - Soldier Creek Shale............................ 208 - 226
(Total Depth)

111.4 Junction with access road to Alvo on right (north).

113.7 Town of Eagle at right (north) of road.

115.5 Leave Cass County and enter Lancaster County (figure 1).

116.1 CAUTION! Cross Missouri Pacific railroad tracks.

120.5 Junction with access road to Walton on left (south).

122.1 Small outcrop of Dakota Group Sandstone in the drainage to right (north) of road.

123.0 East City limits of Lincoln. Turn right (north) on 84th Street.

126.0 Turn left (west) on Havelock Avenue.

127.0 Stop Sign! Junction with 70th Street. Continue ahead (west) on Havelock.
