**Insecta Mundi** is a journal primarily devoted to insect systematics, but articles can be published on any non-marine arthropod. Topics considered for publication include systematics, taxonomy, nomenclature, checklists, faunal works, and natural history. **Insecta Mundi** will not consider works in the applied sciences (i.e. medical entomology, pest control research, etc.), and no longer publishes book reviews or editorials. **Insecta Mundi** publishes original research or discoveries in an inexpensive and timely manner, distributing them free via open access on the internet on the date of publication.

**Insecta Mundi** is referenced or abstracted by several sources including the Zoological Record, CAB Abstracts, etc. **Insecta Mundi** is published irregularly throughout the year, with completed manuscripts assigned an individual number. Manuscripts must be peer reviewed prior to submission, after which they are reviewed by the editorial board to ensure quality. One author of each submitted manuscript must be a current member of the Center for Systematic Entomology. Manuscript preparation guidelines are available at the CSE website.

**Abstract.** The new species *Oxyomus mariateresae* from Mexico (Oaxaca) is described and figured.

**Key Words.** Systematics, *Oxyomus mariateresae*, new species, Mexico, Aphodiinae

**Introduction**

This work belongs to a series of papers describing new taxa in preparation for a systematic revision of Mexican Aphodiinae (Coleoptera Scarabaeidae). The sole species of genus *Oxyomus* Dejean, 1833, previously known from Mexico was *O. setosopunctatus* Schmidt, 1911 that was already redescribed and figured by Dellacasa and Stebnicka (2001).

**Key to American species of *Oxyomus*:**

1. Upperside glabrous. Blackish or brown blackish; sometimes elytra reddish. Length 3.0–4.0 mm. Europe, Mediterranean Africa, southwestern Asia, North America ..... ***O. sylvestris* (Scopoli)**
- Upperside more or less diffusely pubescent ..... **2**
2. Elytral striae catenulate; interstriae with two median longitudinal rows of short yellowish recumbent setae; fore tibiae spur, in males, inwardly curved apically. Dark brownish-grey. Length 3.0–4.0 mm. Mexico (Oaxaca) ..... ***O. mariateresae* new species**
- Elytral striae foveolate; interstriae with one median longitudinal row of short yellowish recumbent setae; fore tibiae spur, in males, straight. Blackish, in some specimens elytra dirty brownish. Length 2.5–3.5 mm. Mexico (Hidalgo, México, Puebla, Veracruz) ..... ***O. setosopunctatus* Schmidt**

**Materials and Methods**

Terminology used in this work to describe morpho-anatomical features follows that of Dellacasa et al. (2001). Materials studied are in the following collections:

- DCGI — Dellacasa Collection, Genoa, Italy  
FSCA — Florida State Collection of Arthropods, Gainesville, FL, USA

***Oxyomus mariateresae* new species**

(Figures 1–5)

**Type locality.** Llano de las Flores, 17°26'37.1"N-096°30'13.2"W, Oaxaca, Mexico.**Type repository.** Dellacasa collection, Genoa, Italy.**Description.** Length 3.0–4.0 mm, oblong, convex, almost dull, pubescent. Dark brownish-grey, anterior angles of pronotum and legs dark brown; antennal club blackish. Head with epistome moderately convex medially, alutaceous, laterally evenly coarsely not very closely punctured; punctures cariose and those toward genae near imperceptibly haired; clypeus feebly sinuate at middle, round at sides, rather thickly bordered, edge anteriorly slightly reflexed, glabrous; genae obtusely round, sparsely ciliate, protruding from eyes; frontal suture finely impressed, somewhat raised at each side and at middle; front widely alutaceous, evenly coarsely punctured. Pronotum transverse, convex, faintly foveolate, longitudinally at middle and obliquely on each side, strongly alutaceous, evenly densely coarsely and somewhat irregularly punctured; punctures umbilicate, cariose, each one with rather short recumbent seta; lateral margins feebly arcuate, somewhat tapered before hind angles, thickly bordered, edge glabrous; hind angles well defined, obtuse; base moderately bisinuate, finely bordered, edge crenulate. Scutellum sunken, alutaceous, superficially confusedly punctured. Elytra moderately convex, feebly widened posteriorly, with deep narrow striae, catenulate on disc, strongly crenulate; interstriae alutaceous, convex, subcarinate medially, densely, coarsely confusedly punctured and with two median longitudinal rows of short yellowish recumbent setae. Hind tibial superior spur as long as first tarsal segment; latter nearly as long as following three combined. Male: fore tibiae spur stout and inwardly curved apically; aedeagus Fig. 2–3. Female: fore tibial spur slender, acuminate and almost straight.**Type material. MEXICO: Oaxaca:** Llano de las Flores, 17°26'37.1"N-096°30'13.2"W, Carretera Tuxtepec, Oaxaca; m 2600, 01.XII.2003, leg. Martínez I. & M.T. Suarez (**holotype**, male, and **allotype** DCGI; 1 **paratype**, male FSCA); Las Cumbres, Carretera Zachila, San Miguel Peras, m 2500, 05.VIII.2000, leg. Martínez I. & Reyes-Castillo P. (1 **paratype**, male DCGI).**Distribution.** Mexico (Oaxaca).**Etymology.** Named in honor of one of its collectors, Maria Teresa Suarez, of Instituto de Ecología, Xalapa, Veracruz, Mexico.**Biology.** Almost unknown; the few specimens of the type series were collected in August and in December.**Acknowledgments**

Thanks are due to P. Bordat (Lagasse, Saint-Cirq) and to T. Branco (Porto) for critical review of the manuscript.
