In the Pacific Northwest there are examples of beads made of shell, seed, and stone whose origins predate contact with Europeans or Americans. Most such beads were strung and then worn around the neck, from the ears or nasal septum, or as small fringes attached to clothing. However, to date, native-made beads have not surfaced in my study area as having been woven into textile-like forms. One possible exception seems to be netted headdresses, some of which were Columbia River women’s puberty or wedding veils worked in dentalium and hide strips, while others in a similar style in Alaska served as aristocratic ceremonial regalia. In California, pieces of abalone shell were netted together to make a dance cap that both glittered in the sun and made a lovely tinkling in movement.

In the late 18th- and early 19th-centuries European and American explorers and traders introduced small glass beads to the indigenous populations of the Pacific Northwest, bringing new elements of sparkle, regularity, and color to their decorative arts. The glass beads also inspired new techniques and fresh expressions, among them the weaving of beads into flat and tubular shapes.

This paper focuses on the various techniques devised by indigenous peoples to incorporate glass beads into their woven products, many of which appear to have derived from earlier fiber traditions, most especially basketry and root storage bags. Both flat and tubular forms of this loose-warp work were created; in this paper we’ll focus on those spirally-woven techniques that resulted in completed pouch or vessel forms not requiring a join to reach completion.

While many tribes in the greater Pacific Northwest made spirally-woven beadwork, here we’ll look at the work of three specific tribes and their near neighbors. Bead woven pieces were created in the Alaska panhandle among the Tlingit, along the Columbia River by the Wasco/Cascades, and in northeastern California along the Pit River and its tributaries, among the Achomawi and Atsugewi. Actual bead weaving by these three groups probably began on the lower- to mid-Columbia River in the 1840s, among the Wasco, Wishxam and Cascades, those

5 As evidenced by a loose-warp bead woven panel bag (#A5697.47-70) in the collection of the Natural History Museum of Los Angeles clearly woven by Columbia River Native people per the motifs of sturgeon,
easternmost of the Chinookan peoples. From there it may have spread north to the Yakima and Klickitat and, with the Klickitat and other Plateau tribes, may have been carried west over the Cascades to the Puget Sound and also south to the Oregon and California/Nevada borders.

Woven beadwork as created by the Tlingit in the last quarter of the 19th century may first have been introduced by more easterly Athapaskan tribes who were themselves exposed to tabbed and panel bags carried by Iroquois/Cree fur traders and later, Cree and Métis settlers in western Canada. What is Bead Weaving and How is it Formed?

As our general focus is a form of beadwork often thought to be loom work, and frequently described as such in museum records and various publications, this section will help to differentiate between loomed and loose-warp woven work.

In loom woven, or secured-warp, beadwork the warp threads are held at either end on a loom or frame and kept taut during working. Generally, all warps are added to the loom or frame at the same time. The finished form is usually a square or a rectangle, the latter sometimes quite a bit longer than it is wide (as in a belt or headband).

In loose-warp bead weaving, however, the act of working may be much more freeform and is largely performed in ways common to how baskets and Plateau root bags are woven. The work most often begins at what we consider the bottom of the piece and a number of warps are connected to an initial section of weft, often at the warp centers, and the work of weaving begins (Figure 1). The exact method varies by tribal area and piece, some examples of which we’ll discuss below. While many examples of loose-warp beadwork were worked flat, others were worked “in the round”, spiraling up and around to create pouch-like forms. In some cases, this spiraling beadwork served to clothe a pre-existing form, most often a bottle or fiber basket.

It helps to know how to differentiate between the two weaving methods when examining woven work to determine its method of manufacture. In loomed bead weaving, as the weft passes over an outer warp to commence the next row, a slant of weft on one outer warp and a wraparound “dot” of weft thread around the opposite outer warp always indicate loomed, or secured warp, bead weaving (Figure 2). Additionally, an “X” of weft threads crossing over each outer edge may sometimes indicate two-needle loomed bead weaving, though the same “X” would be seen with loose-warp bead weaving in which the double wefts are twisted to allow the wefts to secure a finished row to an outside warp and make ready to commence the succeeding row. You would then need to search for other indications in the beadwork itself to determine whether one is observing

fixed- or loose warp-bead weaving. Such signs could include warp threads in the body of the work that exchange places or warps that are drawn tightly down around a narrower bead or around a single bead above or below doubled beads. A clear indication of a paired weft twined around a warp, say if a bead has broken out and the wefts can be seen, would also indicate likely loose-warp bead weaving. These twined wefts in the body of the work could indicate that the piece itself was twined, though more likely it simply means the wefts naturally twisted and turned in the course of working the beads. In order to be certain enough to label a piece as twined rather than simply loose-warp woven, one would need to see a number of broken beads in a row, all displaying twined wefts in the gap where the beads had been.

Bead weaving by the Tlingit Natives

In the northern end of the Pacific Northwest, the earliest regular non-native contact was with Russians and Spaniards in the second half of the 18th century, neither of whom would likely have had bead woven material with them. Trade beads from that period seem largely to have been used for ornament, both of people and objects, although in general the Tlingit people at that time valued trade beads much less than did their brethren to the north and south, preferring iron instead.  

Exposure to beaded objects increased by the end of the first half of the 19th century when the Hudson’s Bay Company and Iroquois/Cree trappers moved into the area. As further beaded pieces filtered in from the Tlingit’s Athapaskan neighbors to the east, they provided the likely source of inspiration for the Tlingit octopus and panel bags.

---

8 Emmons, *Tlingit Indians*, 184. “It is apparent that they [the Kaigani] have a great liking for articles made of iron and of copper, if they be not small. For the beads they did not show a great liking.”

9 Duncan, *So Many Bags*, 57.

10 An octopus bag is a large cloth bag with a number of pendular tabs suspended at bottom. That they are often in four pairs, resulting in eight “legs”, has caused them to be referred to as octopus bags. While it’s (continued)
The overwhelming majority of beaded work made by the Tlingit were beads embroidered on cloth in the form of bags, vests, and dance collars, some of which appear to descend directly from Native armor. A small percentage of Tlingit and Haida bags resemble Cree flat-woven panel bags with the Tlingit/Haida panels being noticeably shorter than Cree panels. The woven Tlingit beadwork with the clearest connection to pre-contact traditions is a number of hair ornaments held in museum collections; earlier examples were composed of “four or five parallel rows of dentalium”, and “fringed with spun goat wool and beads at the bottom”.

In my observation, woven beadworks from this area tend to display geometric motifs. Although most pieces are worked with commercial thread, some early pieces, such as the one in Figure 3, include the use of sinew or Native-made fibers.

Figure 3: National Museum of the American Indian, #024450.000, J.E. Linde Collection, 27cm x 1cm x 12.5cm. Photo by author.

In terms of spirally-beadwoven works originating in the Alaska panhandle, we’ll review a pouch in the J.E. Linde collection at the National Museum of the American Indian in Washington, D.C. Its original purpose may have been to serve as a “wallet”, a woven and flattened bag meant to be folded when in use or perhaps worn suspended over a belt. In the above piece, a section of broken threads at the center of the bag supports the impression that the piece may have been repeatedly folded over and perhaps stuffed under a belt. This beaded bag began with a number of likely cedar warps grouped together and bound with soft, loosely-spun cordage (Figure 4). What

(continued) generally been assumed that this is an antique dealer’s romantic term, Megan Smetzer posits otherwise in *Tlingit Dance Collars*, noting Alex Rasmussen’s conveying to Frederic H. Douglas, director of the Denver Art Museum, that ‘One of my Indian friends tells me that the Tlingit name for the ceremonial pouch is translated ‘devil fish finger pouch’ and the name refers to the four double pendant parts which suggest the 8 tentacles of the octopus’ (March 10, 1938 letter).

12 Author’s personal observation from a number of pieces studied.
may be commercial thread then acted as the weft as the pouch was spirally beadwoven. As the circular bottom of the bag widened, grouped threads were separated into first double, then single, warps to allow for more working warps, much as is true in the construction of many baskets throughout the Pacific Northwest (Figure 5).

Over time, many of these beaded forms were no longer made as fashion, society in general, and Tlingit society in particular changed with the times. In the case of far Pacific Northwest coastal peoples, over the last half century a more particularized form of traditional material has became increasingly popular, with revived forms of regalia including button blankets and beaded octopus bags crowding out the potential revival of more homely and shorter-lived forms of beadwork, including loose-warp beadwoven pouches, baskets, and bottle covers.

Bead weaving by the Wasco Natives

Heading south from Alaska, we arrive at the lower- to mid-Columbia River, home of the easternmost Chinookan peoples: the Wasco, Wishxam, and Cascades. In speaking of the Natives of the Columbia River and their beadwork, we must remember their great and frequent contact with the folks at the Hudson’s Bay Company fur trading post at Fort Vancouver. Passing through the Fort was a considerable profusion of European, American and Asian goods that both enhanced and altered the lives of the local peoples. In return for their furs, fish, camas roots, and woven mats, Native people traded at the Fort for beads, guns, cooking pots, bracelets, and other goods. Additionally, they would have been quite familiar with the sight of the voyageurs and

14 The range of goods traded between parties was considerable. This listing comprises only a small portion of the recorded trade as noted in innumerable publications.
other fur traders with beaded items on their persons,\(^\text{15}\) as well as the beaded leggings of the wife and daughter of Dr. John McLoughlin, the Fort’s chief factor, and other officers’ wives.\(^\text{16}\)

While the names of most Native women who produced beadwork are unknown to us, we know of at least one family along the Columbia River who produced woven beadwork in this area. Mumshumsie and Taswatha were the extremely prolific wife and daughter of Welawa, or Chief Chenewuth, of the Cascades band of Chinook.\(^\text{17}\) (They have variously also been described as Wasco or Klickitat.) This beading family takes its name from Taswatha’s second husband, Amos Underwood, a settler from Ohio. During the second half of the 19\(^\text{th}\) century, Underwood’s land claim was close to his wife’s ancestral homeland, ensuring continued family relations.\(^\text{18}\)

Work produced throughout the area, both in root bags and beadwork, tended to have dissimilar designs front and back (if designs were included on both sides), with geometric motifs on one side and more pictorial, often floral, designs on the other.\(^\text{19}\) Those works considered by many to be among the earliest were often woven on sinew and/or thigh-spun Indian hemp (\textit{Apocynum cannabinum}), though over time commercial thread, usually cotton, supplanted these.

Below is a description of a small sample of the work done in this area; both pieces are assumed to be the work of the Underwoods. The first is a small flat, squarish bag, the work progressing spirally (Figure 6). The number of beads between warps is uneven: sometimes two or even three, a diagnostic I’ve found is generally indicative of earlier work. The simple, two-color loops at bottom appear to be the prototype for a style element common in later Underwood work. Figure 7 shows a far more evenly-worked piece in which the Underwood style has reached its apotheosis. The designs are well thought out and organized in bands separated by horizontal lines. The loops as seen at the bottom of the piece in Figure 6 have finalized in Figure 7 to a small loop at top with a larger loop suspended below, also in a two-color format. The tops of such bags were finely finished with buckskin or ribbon edging, embroidered looped beaded trim, and buckskin handles.

Figure 8: Photograph taken after 1909 by Jonas Loranson, a Toppenish, Washington, photographer. Courtesy Lee and Lois Miner, with special thanks to Richard Storch.
A photograph taken by a Toppenish, Washington, photographer in the early 20th century shows a bag very similar to the one in Figure 7 suspended from the woman’s sash belt (Figure 8). The bags share similar characteristics, including three bands of figures, lighter beads in the central portion of the fringe, and a likely buckskin strap through which the sash belt is threaded.

In addition to these large bags, smaller, more rectangular pouches were also created, perhaps to offer more quickly made goods for sale or gifting. Of the Underwood body of work, these latter bags (not pictured here) are among the most commonly-found examples.

Photographs I’ve examined from the late-1800s, early- to mid-1900s of Indian School attendees from around the country illustrated the growing prevalence of bead looms and frames for the making of Native-woven beadwork. All traces of these spirally-woven bags and loose-warp woven bands and panels seem to have vanished from the photographic record along the Columbia River by about 1920 or so. In their place are more often found loom woven bands, long, rectangular and quite even.

Bead weaving by the Pit River Natives

To conclude, we now head farther south to the home of the Pit River peoples, just south of the Oregon/California border and relatively near Nevada.

Given the comparative isolation of the region, beads took longer to arrive here in any great quantity than they did in other segments of my study area. The territory was largely only passed through by fur traders and explorers until the gold rush began in 1849 and rapacious miners began infiltrating the most distant California watersheds. Of the three areas described, the people-to-people interactions in northern California were among the most destructive to native peoples and their cultures and the recovery periods were among the most difficult.

As regards sources of inspiration, beadwork from the Columbia River area may occasionally have been seen as there was active trade between the Klikitats and other Plateau tribes and the Klamath/Modoc, by which trade beaded objects could have filtered south. Certainly, the few tabbed Native-made pieces I’ve seen from northern California suggest at least a passing awareness of tabbed bags, if not an intimate familiarity.

22 Neils, *The Klickitat Indians*, 70.
The form of Pit River beadwork discussed here will be the beaded purse, of which many hundreds, perhaps thousands, were created. From perhaps 1885 through the mid-20th century, along with other forms such as beaded bottles, chalices, and cups with handles, these bags were popular items for people to make in their homes for sale to white collectors, but native women also proudly wore them as their own, as can be seen in Figure 9 and possibly 10. The most common shape was the square or rectangle with a flap from the extended back hanging over the front, but a significant number were also worked in a diamond shape. I’ve noted that the backs of the bags generally sport the same geometric design as the front and, at least for these bags, the threading material is universally commercial thread, nearly all of black warps and white or cream wefts. Note that I refer to “Pit River” bags, but these bags were likely made by a number of different tribal people in this area of northeastern California, including possibly Klamath, Modoc, and Paiute peoples. However, they are most closely associated with the Pit River people, the Achomawi and Atsegewi.

23 Odgers, The Basketry and Beadwork of the Modocs, Achumawi, and Northern Paiutes, 19, 23.
As with all Pit River bags, the work for these began at the bottom. A number of beads\textsuperscript{24} are threaded on a doubled weft, then warp threads are strung between the beads, through the gap between the wefts, with the center of the warp abutting the beads (Figure 13). One half of each warp thread constitutes either a front or rear warp. At the end of the first and second row, extra beads are added at the sides along with extra warps to allow for the development of depth in the bag. Once the first three rows have been established, the work proceeds spirally to the top of the front, where the warps are then braided and cut. The beading continues as flat work on the remainder of the bag and shortly begins to narrow on both sides to allow for an angled flap. After the flap is completed, beads were often strung on the warps for fringe. The bag in Figure 11 had a handle that was woven in place from extra-long warps used in the side of the bag. The majority of bags however, had handles that were created separately and later attached.\textsuperscript{25} It is possible this change was made due to the fragility of the handle at the point of connection, with separately-made handles being more durable.

\textsuperscript{24}The desired width at bag bottom determines the number of beads strung for the first row.
\textsuperscript{25}Personal observation across many dozens of pieces.
Figure 13. The central horizontal row is first and begins at far right. The added warps at the sides could be either through the wefts or through the beads as shown. Although this diagram appears to show flat work, it is for the sake of clarity only. As the work moves into the fourth through sixth rows, it pulls up into the intended tubular shape.

Figure 14: The bag start at bottom, the first three rows, which set the warps. Photograph and diagram by the author.

Figure 14. The bag finish at front top after the warps were braided and clipped. Photograph by the author.

Figure 15: The reduction of the sides of the flaps, diagram by the author, after Orchard.
The diamond-shaped bags were woven in basically the same way as the square or rectangular bags. However, while the square or rectangular bags began with a first row spanning the width of the bag, the first row of diamond-shaped bags began with as few as one to three beads to anchor the start. The weaving rapidly broadened in both directions from there, with additional warps added per each row until the side apexes were reached. To complete the body of the bag, superfluous warp threads were knotted off in succeeding rows and clipped inside of the bag as the remainder of the rows were woven in a narrowing format until the top of the front of the bag was reached. The construction of the flap proceeded as above while reducing the flap to a point.

Colors were more subdued in earlier examples of Pit River beadwork. Over time, the beads became brighter and the shapes and construction methods of both handles and bags grew more varied. Of the three tribal areas described in this paper, the creation of spirally-woven beadwork in northern California continued the longest, with some work continuing into the 1970s.

Changes, Great and Small

As white settlers poured into the Northwest in the 1800s, creating villages, towns and cities, and crowding out the original peoples who’d lived here for millennia, Native peoples were forced by circumstance to adapt to the changed economic environment. Native men worked in lumbering, fishing, and on ranches; native women worked as domestics. Both harvested local food products which they sold or traded to white settlers, and women made craft products such as baskets, moccasins, gauntlets, and beadwork and sold or traded those as well.

In looking at and examining hundreds of pieces, I’ve observed that in general pieces of embroidered beadwork throughout the greater Pacific Northwest vastly outnumbered woven beadworks, with the loose-warp woven works discussed in this paper comprising only a fraction even of that. This suggests that a much smaller percentage of the female population chose to do this more fiddly and time-consuming work than did those who chose to embroider beads onto cloth or use a bead loom/frame.

Regrettably, it’s impossible to know who crafted the first loose-warp beadwork in any of these areas, though one might readily imagine that those well versed in basketry may have been the original and most skilled practitioners. Nonetheless, we are thankful that so many of their works and those of their successors have survived, being both available for study and allowing us to appreciate the beauty of the bags and the creativity and skill of their makers. May these sleeping forms yet awaken and be renewed.
