### Journal Bibliometric Analysis: A Case Study on Internet Research

**Dr. Dillip K Swain** 

KIIT University, Bhubaneswar, Odisha, India

#### Abstract

This paper aims to evaluate the pattern of publications of *Internet Research (IR)* from 2008 to 2012 and to reveal the research influence of this journal from the citing and cited references of the papers through appropriate bibliometric measures. The study analyses five volumes of *Internet Research* from the year 2008 to 2012. Citations to each of the published articles are explored through Google Scholar for assessing average impact of individual paper. Citation record for measurement of impact factor and immediacy index was extracted from Scopus. It is found that the average length of articles published in IR is 19.83 ranging from year wise average of 18.63 to 21.96 pages. The study revealed the domination of collaborative research and the degree of collaboration (DC) in Internet Research is found to be 0.83. The numbers of references used by the authors are high with majority of them citing 41 to 50 references and on an average, Internet Research authors have cited over 53 references per article. It is found that more than two third of citations reflected in *Internet Research* are emanated from journals followed by books. However, proceedings of conferences/seminars, and e-citations referred by authors were found quite less and negligible. The study further reveals that major share of contribution to the publications of Internet *Research* hails from Taiwan, followed by Spain, and USA. However, UK occupies the 4<sup>th</sup> rank by scores though the number of authors of this country is lesser than that of South Korea. Moreover, the study reveals that a total number of 148 source articles published in Internet Research have received in all 1783 Google Scholar citations averaging 12.04 citations per paper. The journal citing half life is 6.65 years and the average age of citations is 9.71. Additionally, 2012 Impact Factor of Internet Research (based on record of Scopus citations) is computed to be 1.900 and immediacy index is 0.241.

**Keywords:** Bibliometric study, bibliometric analysis, equal credit method, h-index, country productivity ranking, impact factor, immediacy index, average age of citations, self-citations, Google Scholar

#### Introduction

Bibliometrics is the application of statistical and mathematical methods to bibliographical studies and all forms of written communications (Hazarika, Goswami and Das, 2003). Bibliometrics has developed as a type of quantitative research method used in information science to describe patterns of publication within a given field or body of literature to identify the pattern of publication, authorship, citations and journal coverage with the hope that such studies can give an insight into the dynamics of the field under consideration (Vijaykumar and Naqvi, 2002; Warraich and Ahmad, 2011; Rodríguez-Ruiz, 2009). Bibliometric research methodologies of library and information science have always been used to provide tools for understanding the stature of disciplines, developing policy, and justifying research funding (Noruzi, 2006). Moreover, bibliometric methods are used in studies of properties and behavior of recorded knowledge, for analysis of the structures of scientific and research areas, and for evaluation of research activity and administration of scientific information (Patra, et al, 2006). Thus, it is an ideal field for academic librarians to develop and provide innovative services for both academic and administrative university staff. In so doing librarians make sure to take an active part in the development of new strategies and in fostering innovation. Qualitative processes like peer-review need to be validated and are therefore increasingly complemented by quantitative methods like bibliometrics (Gumpenberger, et al, 2012). The idea of studying journal articles to perform a bibliometric study to gain ideas about a journal, author, or topic is a natural progression from earlier types of research in the field (Epstein, 2005; Iovino, 2008). More particularly, when a single journal is studied bibliometrically, it creates a portrait of the journal, providing a description that offers an insight that is beyond the superficial. It can indicate the

quality, maturity and productivity of the journal in any field, in a country or region. It also informs us about the research orientation that it supports to disseminate and its influence on author's choice as a channel to communicate or retrieve information for their research needs (Anyi, Zainab and Anuar, 2009). Contextually, the present study attempts to measure the pattern of publication of *Internet Research* (*IR*) from 2008 to 2012.

*Internet Research* is an international, refereed journal that aims to describe, assess and foster understanding of the role of wide-area, multi-purpose computer networks such as the Internet besides looking at the technological developments which facilitate the use of wide-area networks, the journal examines the social, ethical, economic and political implications which arise from mass public access to information resources. *IR* is indexed in all major indexing and abstracting databases of the world. The 2012 ISI Impact Factor of *Internet Research* is 1.500 (www.emeraldinsight.com/intr.htm). A bibliometric analysis based on citing and cited references of the papers of *IR* may provide sufficient indications about the influence and impact of this journal among readers and research scholars across countries.

#### Objectives

The key objectives of the study are depicted as under:

- To find out the average length of article published in *IR*;
- The study the authorship pattern and measure the degree of authors' collaboration;
- To study the range of references used by *IR* authors;
- To study the ranking of bibliographical forms of documents by the number of their citations;
- To study the country wise share of contributions to *IR* publications;
- To identify the core journals that are frequently cited in *IR* papers;
- To study quantum of citations of *IR* papers recorded in Google Scholar;
- To find out half life of journal citations and the average age of citations; and
- To measure 2012 Impact Factor and immediacy index of *IR*

#### **Materials and Methods**

The html version of Emerald articles published in *IR* from 2008 to 2012 is the major data source of the present paper. The lists of references of each and every article were collected from the mentioned ource along with front page information of the respective articles carrying details of authors' geographical affiliations, types of papers, keywords, and page range of the article. The data was then segregated aspect wise and put into excel spread sheets for making the analysis convenient. The study employed authentic bibliometric measures to elicit concrete findings. Moreover, Google Scholar (GS) was used to explore the *total citation counts* of the published articles, *authors self citations*, and *journal self citations* of each and every paper published during the stated period. The citation record of the source journal available with Scopus was exported to excel file for computing Impact Factor (IF), and immediacy index of the journal.

#### **Review of literature**

Several bibliometric studies on single journals in various fields have been carried out by research scholars from different parts of the world, out of which some of the pertinent studies need to be highlighted. In this direction, Tsay (2008) analysed the citations published in JASIST in 1980, 1985, 1990, 1995, 2000 and 2004 with a vivid examination of the document type, the most cited resource, the country and subject distribution of articles. Garg (2003) studied articles published in *Scientometrics* from 1978 to 2000 and made a comprehensive assessment of national and institutional characteristics of papers published in this journal. Tiew, Abdullah and Kaur (2002) studied *Malaysian Journal of Library and Information Science* from 2006 to 2000 and found that this journal published 8 articles per issue on an average and each article had an average of 22.5 references. They further revealed that multi-authored articles outnumbered single-authored articles. Park (2010) revealed author collaboration, authors' affiliations, and geographical distribution of authors of the first 13 years publication patterns of *D-Lib Magazine*.

Swain (2011) conducted a bibliometric study of Library Philosophy and Practice (LPP) from 2004-2009 and found that major cited journals in LPP were from the core field of Library Science followed by Education, Medical Sciences, Sociology, Psychology, and Computer Science indicating a healthy trend of multidisciplinary research. The study observed that authorship productivity pattern of LPP partially complied with Lotka's Law. Swain and Panda (2012) in the bibliometric study on Journal of Intellectual Property Rights revealed that the visibility of collaborative contribution in the journal was found remarkably less. More than half of the journal articles carried just 1 citation, one fourth got 2 citations, and the rest received citations between 3 to 9 times and the average number of citations against all published articles was found to be 0.66 per article. Tsay (2011) vividly demonstrated the bibliometric characteristics of the Journal of Information Science and the subject relationship with other disciplines. Jena, Swain and Sahu (2012) studied The Electronic Library (TEL) from 2003 to 2009 and found that solo research in TEL is predominant and the average length of article reported was 13.017 pages. Moreover, they found that, majority of citations were from journals followed by web resources, and books; the half life of journal citations and book citations were reported to be 5 and 7 respectively. Swain, Jena and Mahapatra (2012) in the bibliometric study of the journal Interlending & Document Supply (ILDS) observed that majority of ILDS' journal citations belonged to the publishing year and the next year of publication; and the half life of journal citations was estimated to be 1 year which indicated that ILDS authors preferred to cite recent documents in their scholarly papers. Isiakpona (2012) indicated low level of collaboration among authors of the articles published in the LIBRES Research Electronic Journal and the degree of collaboration was found to be 0.279. Das (2012) in his Bibliometric study of Nelumbo (plant taxonomy journal) found that half of the papers published in the journal were contributed by two authors and just one fourth of articles were contributed by single authors. Lokhande (2013) revealed the multi-authored characteristics of Annals of Library and Information Studies from 2002 to 2011 through a vivid content analysis. Regolini and Jannes-Ober (2013) revealed the high degree of transdisciplinarity of Informing Science. They considered the impact of 184 articles and found that the h index for those articles was 12. However, the present paper is yet again another case study on the publication characteristics of Internet Research which is unexplored.

#### Analysis

#### Year wise distribution of types of articles

Table I shows that *IR* has published a total number of 148 articles from 2008 to 2012 averaging over 29 articles per year (5 issues). It is understood that *IR* has accommodated on an average 5 to 6 papers in each issue. Majority of articles published in *IR* are *research papers* (87.83%; 130 articles) followed by *general review* and *conceptual paper* (4.05%; 6 articles) each. However, *literatures review* (2.70%; 4 articles), *case study* and *view point* (0.67%; 1 article) each have found their presence quite less.

Types of Articles	2008	2009	2010	2011	2012	Total
Research Paper	27	27	21	27	28	130
General Review	0	1	5	0	0	6
Conceptual Paper	0	0	5	1	0	6
Literature Review	1	2	0	1	0	4
Viewpoint	1	0	0	0	0	1
Case Study	0	0	0	0	1	1
Total	29	30	31	29	29	148

Table I. Year wise distribution of types of articles

### Length of article

It is found from table II that the average length of article published in IR is 19.83 ranging from year wise average of 18.63 to 21.96 pages. It is inferred that IR has published articles of standard length by giving enough scope to its authors to report their research results at length so that no significant aspect of their respective research is left out from the purview of their research presentation and discussion.

Year	Total Pages	Cumulative pages	Total no. of articles	Cumulative articles	Average pages per article
2008	559	559	29	29	19.28
2009	559	1118	30	59	18.63
2010	587	1705	31	90	18.94
2011	594	2299	29	119	20.48
2012	637	2936	29	148	21.96
	•	Cumulative av	erage pages per article=1	19.83	

Table II. Length of article

#### Authorship pattern

Table III shows that the majority of publications in *IR* has been contributed by three joint authors (50 articles; 33.78%), followed by two joint authors (48 articles; 32.43%) and > Three joint authors (26 articles; 17.57%). However, articles contributed to *IR* in single authorship mode (24 articles; 16.22%) is found to be at the bottom. Therefore, it is evident that research in *IR* is dominated from the collaborative front bearing in mind the positive correlation between institutional and international collaboration and the high number of citations of collaborating authors as compared to single authorship as opined by <u>Narin et al.</u>, (1991), <u>Chinchilla-Rodríguez et al.</u>, (2010) and Cantos-Mateos, et al.(2012).

Authorship pattern	2008	2009	2010	2011	2012	Total	% of the total publications
Single	3	3	4	9	5	24	16.22
Two	11	10	9	8	10	48	32.43
Three	13	8	9	9	11	50	33.78
> Three	2	9	9	3	3	26	17.57
Total	29	30	31	29	29	148	100.00

#### Table III. Authorship pattern

#### **Degree of collaboration**

The precise nature and magnitude of collaboration cannot be easily determined by the usual methods of observation or interview because of the complex nature of human interaction that takes place between or among collaborators over a period of time (Subramanyam, 1983; Katz and Martin, 1997). However, the extent of collaboration made in a particular domain or a given set of literature can be measured through some quantitative techniques. In this direction, Subramanyam (1983) has developed a formula for calculating degree of collaboration as:

$$DC = \frac{NM}{NM + NS}$$

Where: DC=Degree of collaboration; NM=number of multiple authored papers; and NS=Single authored papers. By putting the value of NM (=124) and NS (=24) in the above equation, the degree of collaboration (DC) in IR is found to be 0.83. As the degree of collaboration exceeds 0.5, it indicates a high degree of collaborative research in IR which is already evident from Table III.

#### **Range of references**

The listing of references in publications is a convention among scientists for giving credit or recognition to the value of previous work (Merton, 1988). It is evident from table IV that, the numbers of references used by the authors are high with majority of them citing 41 to 50 references that is indicated by the tallest bar in figure 1. The table further reveals that, though the authors have more frequently used 41 to 50 (f=26) citations in their papers, the percentage of citations to the total citations in the range of 71 to 80 references (f=17) is little higher. On an average, *IR* authors have cited over 53 references per article. Hence, it is inferred that *IR* authors have conducted their research with ample evidences from earlier studies.

	frequency of citations		citations		citations
3	3	9	9	0.11	0.11
15	18	239	248	3.00	3.11
18	36	484	732	6.08	9.19
16	52	581	1313	7.30	16.49
26	78	1213	2526	15.23	31.72
14	92	775	3301	9.73	41.45
14	106	926	4227	11.63	53.08
17	123	1239	5466	15.56	68.64
11	134	924	6390	11.60	80.24
4	138	390	6780	4.90	85.14
10	148	1184	7964	14.87	100.00

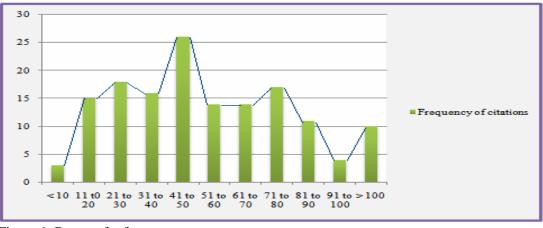

Figure 1. Range of references

#### Year wise distribution of bibliographical forms of citations

Table V shows that more than two third of citations reflected in *IR* are emanated from journals (70.61%) followed by books (13.96%). However, proceedings of conferences/seminars (5.31%), and e-citations (4.75%) referred by *IR* authors were found quite less and negligible. The highest journal citations was recorded in 2012 and the lowest in 2009.

Bibliographical forms	2008	2009	2010	2011	2012	Total	Percentage
Journals	1030	797	900	1369	1527	5623	70.61
Books	222	186	212	267	225	1112	13.96
E-Citations	65	107	58	72	77	379	4.76
Proceedings	39	104	109	54	117	423	5.31
Others	84	97	115	64	67	427	5.36
Total	1440	1291	1394	1826	2013	7964	100.00

Table V. Year wise distribution of bibliographical forms of citations

#### **Distribution of keywords**

Keywords play the major role in retrieval of the documents from the vast sea of literature. Keywords help indexing the documents at their relevant places in different indexing databases so that users can browse their required documents easily and conveniently as most of the times they approach documents by keyword searches. An improper setting of keywords by the authors or editors may put the documents at obscurity leading to poor visibility and accessibility of valuable works and thereby drawing low citations. Keywords that have been featured in the structured abstracts of *IR* articles at least for 5 times are presented in table VI. It is found that 'internet' as a keyword, has become the first and foremost choice by the authors and editor, which has occurred as many as 58 times followed by 'electronic commerce', 'consumer behavior', and 'trust'. The keywords which have been indexed in the structured abstract for a minimum of 5 times include, 'brands', 'communication', 'customer loyalty', 'information exchange', 'online operations', 'social networking sites', 'auctions', and 'data analysis'.

Table VI. Distribution of keywords

Keywords	Frequency	Keywords	Frequency
Internet	58	Customer satisfaction	6
Electronic commerce	28	Data security	6
Consumer behaviour	26	User studies	6
Trust	16	Brands	5
Communication technologies	15	Communication	5
Worldwide web	14	Customer loyalty	5
Taiwan	13	Information exchange	5
Computer networks	7	Online operations	5
Consumers	7	Social networking sites	5
Innovation	7	Auctions	5
Social networks	7	Data analysis	5

#### **Prolific authors**

There are some authors who develop great interest and enthusiasm to write for a specific journal and continue to write frequently and regularly whom we call prolific authors. It is evident from the study that *IR* has not accommodated any author who has contributed more than *three* articles since 2008 and 2012. There are a total number of *eight* authors who have contributed maximum three articles, out of which *three* authors belong to Taiwan, *three* from Spain and *one* from USA and *one* from Netherlands. It is apparent that authors have hardly found any time slot to get published more than three times may be due to a longer queue in the publication pipeline of the journal. The ranking of authors by their number of contributions is depicted in Table VII for a view.

Sl No	Rank	No of papers	Name of the author	Country
1	1	3	Binshan Lin	USA
2	1	3	Ching-Jui Keng	Taiwan
3	1	3	Federico Barrero	Spain
4	1	3	Hui-Ying Ting	Taiwan
5	1	3	Kuo-Ming Chu	Taiwan
6	1	3	Peter C. Neijens	Netherlands
7	1	3	Sergio L. Toral	Spain
8	1	3	Francisco J. Martínez-López	Spain
9	2	2	Ching-I Teng	Taiwan
10	2	2	Chung-Chi Shen	Taiwan
11	2	2	Dov Te'eni	Israel
12	2	2	Echo Huang	Taiwan
13	2	2	Edith G. Smi	Netherlands
14	2	2	Edward C.S. Ku	Taiwan
15	2	2	Eldon Y. Li	Taiwan
16	2	2	Francisco Cortés	Spain
17	2	2	George J. Avlonitis	Greece
18	2	2	Hilde A.M. Voorveld	Netherlands
19	2	2	Hui-Chun Chan	Taiwan
20	2	2	Hyeonjoo Seol	South Korea
21	2	2	Javier Aracil	Spain
22	2	2	Jennifer Rowley	UK
23	2	2	Jeong-Dong Lee,	South Korea

33	2	2	Tsung-Hsien Kuo	Taiwan
34	2	2	Yoshikiyo Kato	Japan
35	2	2	Yu-Jen Chou	Taiwan
36	_	1	304 authors	-

Table VII. Ranking of authors by number of contributions

#### Country productivity ranking by equal credit method

By equal credit method, each article is assigned one point which is equally shared by the contributors representing different countries. If an article is contributed by n authors, then each contributor will earn 1/n points for his country (Chua et al., 2002; Lowry, et al., 2007; Serenko et al., 2010; Swain et al, 2012). Table VIII reveals that major share of contribution to the publications of *IR* is emanated from Taiwan (83 authors; 39.15 scores) followed by Spain (70 authors; 21.63 scores), and USA (41 authors; 17.74 scores). However, UK (20 authors; 8.08 scores) occupies the 4<sup>th</sup> rank by scores though the number of authors of this country is lesser than that of South Korea (27 authors; 8 scores). The research productivity of Singapore appears to be very less with just one author earning 0.333 scoring points presumably through cross country collaboration.

Table VIII. Country productivity ranking

Sl. No	Rank	Country	Score	No of authors
1	1	Taiwan	39.15	83
2	2	Spain	21.63	70

3	3	USA	17.74	41
4	4	UK	8.08	20
5	5	South Korea	8	27
6	6	Japan	5.5	25
7	7	Greece	4.75	15
8	7	Israel	4.75	12
9	8	Netherlands	4.66	12
10	9	Australia	4.41	14
11	10	Canada	3.41	5
12	11	Iran	3	8
13	12	China	2.99	7
14	13	Germany	2.5	4
15	14	Hong Kong	2	4
16	14	UAE	2	3
17	15	Malaysia	1.75	6
18	16	India	1.66	4
19	16	Turkey	1.66	4
20	17	Argentina	1.5	4

28	20	Pakistan	0.5	2
29	21	Singapore	0.33	1
	Total			388

#### Ranking of journals cited by IR authors

A total number of 1111 journals have been cited by authors for cumulative total of 5623 times. It is evident from table IX that *Internet Research* (the source journal) tops the table with 260 citations constituting 4.61 per cent of total citations, followed by *Information & Management* (187 citations; 3.32 per cent), *Journal of Marketing* (155 citations; 2.36 per cent), and *MIS Quarterly* (147 citations; 2.61 per cent). Interestingly, it is observed that *IR* authors have given almost equal importance for exploring literature form some other journals. In this respect, the value of Source Normalized Impact per Paper (*SNIP*) (Moed, 2010) of key journals cited in *IR* papers was obtained from Scopus for assessing the relative value of respective journals. It is found that the authors of *IR* have rightly explored their research materials from a few other journals which are ranked higher than *Internet Research*.

Sl	Rank	Name of the journal	Total citations	% of	SNIP*
No.				citations	
1	1	Internet Research	260	4.61	1.382
2	2	Information & Management	187	3.32	2.904
3	3	Journal of Marketing	155	2.36	4.493
4	4	MIS Quarterly	147	2.61	3.885
5	5	Journal of Consumer Research	125	2.22	2.614
6	6	Journal of Marketing Research	122	2.16	2.269
7	7	Journal of Business Research	109	1.93	1.817
8	8	Information Systems Research	107	1.90	2.670
9	9	Management Services	100	1.77	-
10	10	Journal of Retailing	94	1.67	2.281
11	11	Communications of the ACM	93	1.65	4.619
12	12	Journal of Interactive Marketing	88	1.56	1.372
13	13	International Journal of Electronic Commerce	74	1.31	1.340
14	14	Journal of the Academy of Marketing Science	69	1.22	2.859
15	15	Journal of Management Information Systems	66	1.17	1.984

Table IX. Ranking of journals by number of citations reported in IR

#### Citing half life and average age of journal citations

The cited half-life is a measure of the rate of decline of the citation curve. It is the number of years that the number of current citations takes to decline to half of its initial value (Amin and Mabe, 2000). Table X reveals that the citations of journals in *IR* start declining at the age of 6 years (though it partially overflows to Sen's (1999) predicted critical year-7th year) which is evident from table X. Further, the citation curve in figure 2 indicates that the initial portion of the graph up to 6 years follows straight line pattern showing the citations concentration which is further extended right up to 11 years (carrying cumulative citations of 73.87%). Thereafter, there is a deviation of straight line pattern up to 67 years showing low concentration of citations and the horizontal straight line portion of the graph from 67 to 91 years indicates the steady and low frequency of citations. In a nutshell, it is inferred that the cream of journal citations in *IR* is confined within 7 years of their publications (calculated citing half life=6.65).

\*Subcritical year \*\*Critical year

Taking the data from table X, we can measure the *average age of journal citations* ( $AC_a$ ) in *Internet Research* from 2008 to 2012 by dividing sum of *scores of citations* to sum of *total citations* using a simple **formula**:

$$AC_a = \frac{\sum c_a \times c_n}{\sum c_n}$$

Where:  $AC_a = Average Age of citations$ ;  $C_a = Age of citation$ ;  $C_m = Number of citations$ 

Applying the formula mentioned above, average age of citations  $(AC_a)$  from the obtained data set of *Internet Research* from 2008 to 2012 is calculated as:

AC<sub>a</sub> (*in* Internet Research) =  $\frac{54617}{5623}$  = 9.71

Hence, it is understood that though the half of the citations in *IR* fall within 7 years (half life=6.65) of publications of respective journals, the *average age of cited journals* is a bit higher than the half-life of citations because *IR* authors have cited many articles published way back to more than 50 years.

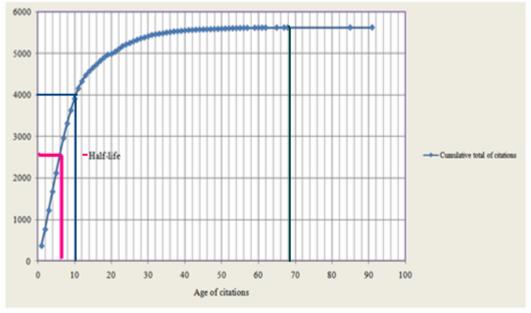

Figure 2. Journal citing half-life

#### Analysis of citations recorded in Google Scholar

The citations to source articles of *IR* were explored through Google Scholar (GS) for providing a clear and magnified picture of the impact and influence of IR articles all around. The year wise distribution of citations of *IR* papers is depicted in table XI for a view.

Publication year	GS citations	% of citations	Author self citations	% of author self citation to total citations	Journal self citations	% of journal self citation to total citations
2008	637	35.73	31	1.74	46	2.58
2009	655	36.74	49	2.75	64	3.59
2010	223	12.51	38	2.13	28	1.57
2011	221	12.39	10	0.56	57	3.20
2012	47	2.64	5	0.28	14	0.79
Total	1783	100.00	133	7.46	209	11.72

Table XI. Year wise distribution of total citations vs self citations

Note: The citation data retrieved from Google Scholar during last week of April, 2013

It is evident from Table XI that a total number of 148 source articles published in *IR* have received in all 1783 GS citations averaging 12.04 citations per paper. Furthermore, it is observed that out of 148 papers, 133 (89.86%) papers received citations where as only 15 papers (10.13%) so far left uncited (see appendix).

#### Self-citations

Academics cite themselves to a greater or lesser extent; the frequency of self-citation often varies depending on the field in which the author works (Snyder and Bonzi, 1998). Self-citation will clearly inflate an author's overall citation count and potentially at least could also inflate their *h*-index (Norris and Oppenheim, 2010). Author self-citation refers to citing one's previous publications in a new publication. Author self-citation exists when the citing and cited papers have at least one author in common. Although authors may have good reasons to cite their own works, these citations do not necessarily reflect the importance of their work or its impact on the rest of scientific community (Fowler and Aksnes, 2006). Author self-citations may misrepresent the importance of individual articles; skew the calculation of journal impact factors, and bias perceptions of the importance of a publication (Davarpanah and Amel, 2009). The characteristics and patterns of journal self-citation may completely differ from those of author self-citation. An author may never cite his own previously published papers, and yet still cite others' papers published in the same journal, creating an incidence of journal self-citing without author selfcitation (Huang and Lin, 2012). Therefore, a journal editor can hardly object an author to cite others paper of the same journal. Similarly, authors can not always follow the rule of the thumb. Irrespective of all consequences, they sometimes need to acknowledge their previous works, may like to promote their own work at the initial stages, or even find some relevant substances from their already published work. In such situation, how can they completely ignore their creditable previous works? Similar is the situation for a source journal. Can it always ask potential authors to completely delete some of the outstanding works already published in it from their reference list for the sake of improving its impact factor or hindex? Nevertheless, self-citation for citation sake or journal self citation by the author for winning the favor of the editor should always be discouraged.

Moreover, it is observed that the authors' self citation tendency was a bit more in 2009 in comparison to other publishing years and it has gradually declined to reach a minimal point in 2012. However, journal citation trend is constantly up and down but never gone over 4% of total citations. It is further evident that the aggregate authors' self citations (7.48%) is quite understandable and journal self citation (11.92%) is very reasonable. This speaks volumes about the maturity of the editorial policy of *IR* that gives top

priority on the quality of publications. Hence, it is deduced that the learned editorial board of *IR* have made a good balance of the issues discussed above.

#### **Highly Cited papers**

The article entitled, "Understanding the appeal of user-generated media" by Guosong Shao of USA published in 2009 (volume 19 issue 1) carrying 102 bibliographical references has so far received 127 citations (see appendix) without any self citations but the source journal has cited it for 4 times may be due to authors' choice for this extraordinary piece of work. In the same year of publication, another article entitled, "Social ties and online word of mouth" by Erin M. Steffes and Lawrence E. Burgee of USA (ranked third) containing 38 bibliographical references attracted 81 citations without any self citations and with 6 journal self citations for obvious reasons. The quantum of citations to these two articles shows why citations to 2009 publications are at top. The second most highly cited paper entitled, "The impact of electronic word-of-mouth" by Christy M.K. Cheung, Matthew K.O. Lee, and Neil Rabjohn of Hong Kong appeared in 2008 (volume 18 issue 3). The article carrying 61 bibliographical references drew 118 citations in total that included 6 author self citations and journal self citations each. The ranking of highly cited papers are presented in table XII in decreasing order of their citations for a view.

Sl. No.	Title	Author(s)	GS Citations	Self Citations	Citations in IR
1	Understanding the appeal of user-generated media	G Shao	127	0	4
2	The impact of electronic word-of-mouth	CMK Cheung, et al	118	6	6
3	Social ties and online word of mouth	EM Steffes, LE Burgee	81	0	6

Table XII. Highly cited papers

#### Impact factor and immediacy index of IR (based on Scopus citation record)

Impact factor is one of the key bibliometric measures to rate and evaluate the standard of a specific journal. The idea of impact factor was first introduced by Dr Eugene Garfield in 1955 (Garfield, 2006). The impact factor of a journal is calculated by dividing the number of current year citations to the source items published in that journal during the previous two years (Sen, 1999; Zainab, et al, 2009; Arnold and Fowler, 2011). Citation of IR papers recorded in Scopus (Table XIII) is taken into consideration for the calculation of 2012 impact factor of *Internet Research*.

Year of Publication	No of publications	Citations in 2012	Citations in 2012 (excluding self citations)	h-index	h-index (excluding self citations)
2008	30	75	74	11	11
2009	29	96	83	11	10
2010	31	57	45	7	6
2011	29	57	53	5	5
2012	29	7	3	2	2
Total	148	292	258	-	-

Table XIII. Citations of IR papers recorded in Scopus

Sen (1999) has demonstrated the use of impact factor calculation in Journal Citation Reports as:

$$I_{f(j)} \!=\! \tfrac{\mathcal{L}_1 + \mathcal{L}_2}{s_1 \!+\! s_2}$$

Where, I  $_{f(j)}$  is Impact factor for journal j for the year Y. S<sub>1</sub> is the source items published in the journal in the year Y-1. S<sub>2</sub> is the source items published in the journal in the year Y-2. C<sub>1</sub> is the number of citations S<sub>1</sub> source items received for the year Y. C<sub>2</sub> is the number of citations received by S<sub>2</sub> source items in the year Y.

Putting the obtained values of C<sub>1</sub>, C<sub>2</sub>, S<sub>1</sub>, and S<sub>2</sub> (from table VIII) in the above equation, 2012 Impact Factor of IR =57+57/31+29=1.900 and 2012 Impact Factor of IR (excluding self citations) =45+53/31+29=1.63.

In this situation, Immediacy Index as explained by Sen (1999) can be expressed through the formula:

$$\mathbf{I}_{\mathrm{x}(\mathrm{IR})} = \frac{c}{s}$$

Where,  $I_{x (IR)}$  is the immediacy index of the journal *Internet Research* in the calendar year 2012. **S** is the number of source item published in the year 2012; **C** is the number of citations received in the year 2012 by the source items of 2012. By putting the value of **C** and **S** in the above equation, the immediacy index of *Internet Research* is found to be 0.241 (7/29).

#### **Key findings**

The major findings of the study are highlighted as under:

- 1. It is found that the average length of article published in *IR* is 19.83 ranging from year wise average of 18.63 to 21.96 pages;
- 2. The study shows that the majority of publications in IR has been contributed by three joint authors, followed by two joint authors and > Three joint authors indicating the domination of collaborative research;
- 3. The degree of collaboration (DC) in *IR* is found to be 0.83;
- 4. It is evident that, the number of references used by the authors are high with majority of them citing 41 to 50 references (f=26) and the percentage of citations to the total citations in the range of 71 to 80 references (f=17) is little higher. On an average, *IR* authors have cited over 53 references per article;

- 5. It is found that more than two third of citations reflected in *IR* are emanated from journals (70.61%) followed by books (13.96%). However, proceedings of conferences/seminars (5.31%), and e-citations (4.75%) referred by *IR* authors were found quite less and negligible;
- 6. The study reveals that major share of contribution to the publications of IR is emanated from Taiwan, followed by Spain, and USA. However, UK occupies the 4<sup>th</sup> rank by scores though the number of authors of this country is lesser than that of South Korea. The research productivity of Singapore appears to be very less.
- 7. *Internet Research* (the source journal) tops the table with 260 citations constituting 4.61 per cent of total citations, followed by *Information & Management* (187 citations; 3.32 per cent), *Journal of Marketing* (155 citations; 2.36 per cent), and *MIS Quarterly* (147 citations; 2.61 per cent). Though the source journal has taken the lead, but the self citation tendency is very less and quite negligible;
- 8. The study reveals that a total number of 148 source articles published in *IR* have received in all 1783 Google Scholar citations averaging 12.04 citations per paper. It is observed that out of 148 papers, 133 (89.86%) papers received citations where as only 15 papers (10.13%) so far left uncited
- 9. The half life of citing journals is 6.65 years and the average age of citations is 9.71; and
- 10. 2012 Impact Factor of *Internet Research* (based on Scopus citation counts) is computed to be 1.900 and immediacy index is 0.241.

#### Conclusion

The editor must be able to attract authors who publish original and innovative research that captures the attention of the international scientific community. To maximize the impact one needs establish high standards and avoid becoming a dumping ground for mediocre or inferior research (Garfield, 2003). In this regard, *Internet Research* seems to be very careful, cautious and meticulous as it is reflected form the study. It has strived to maintain a standard norm for its authors to meet its publication pattern so that the published papers can get subsequent impact and influence among the readers and the researchers' community. The great number of 1783 Google Scholar citations to 148 papers carrying a rate of 12.04 citations per paper shows how well most of its articles have received impact all around. It is implicit that the articles of *Internet Research* are appropriately indexed in all the major indexing databases available across the world facilitating all relevant articles to be easily accessed and retrieved world wide.

Several methods, not necessarily with nefarious intent, exist for a journal to cite articles in the same journal which will increase the journal's impact factor (Fassoulaki et al, 2002; Agrawal, 2005). It is observed from the study that *Internet Research* is proactive, prudent and wise enough in this particular issue to limit the citations to its own publications (11.72%) to a very genuine and reasonable extent. Presumably, IR has adopted some necessary policy to advise its authors only to choose the selected specific articles published in the source journals which can give true substance to their own research and subsequently add value to the journal as well. Moreover, collaborative trends, the authors' act of using sizable range of references in making of their papers, citing references of standard journals, minimal rate of self citations (7.48%), and impressive impact factor are all testimony to the meticulous editorial policy of the journal. Furthermore, it is deduced that Internet Research follows a standard mechanism through its efficient editorial policy monitored by its learned editorial board and prudent panel of reviewers and the journal may strive to improve its editorial policy further to make it more vibrant and influential among the academic and research community by adopting any possible constructive measures in future. It is expected that IR will grow its stature further by augmenting its influential characteristics and impact among its readers, peers and academic community at length consequently taking its reputation to a lofty height!
