## THE "NEBFARM" PROJECT AS A SOURCE OF FARM MANAGEMENT DATA

The information presented in this report is available as the result of a continuing project conducted with farmers in Nebraska by the Agricultural Extension Service, The Nebraska State Department of Vocational Education, and the Department of Agricultural Economics of the University of Nebraska. The name "NEBFARM" stems from words which describe the goals of the project--Nebraska Electronic Business Farm Accounting Records for Management. The purposes are: (1) to bring the speed and accuracy of electronic data processing equipment to bear on the data problems which farm businessmen must cope with in order to have available adequate information on which to base their annual and long-run management decisions, (2) to provide educational meetings and materials to farmers who have data on their farms available showing ways in which this information may be used, and (3) to maintain a continual flow of reliable information about various types of farms operating in the state to the College which may be used for research and teaching and in publications such as this report.

### Operation of the Project

The project is operated in the field cooperatively by the Agricultural Extension Service, County Extension Services, and a number of Vocational Agriculture Departments within high schools over the state. Farmers who desire to participate enroll through their local County Agent or Vocational Agriculture Instructor. An enrollment fee covers the cost of materials and clerical help required to operate the project. This fee ranges from fifty to about one-hundred-fifty dollars, depending on the size of the individual farm and the number of optional special accounts to be processed. The average fee is sixty-five dollars.

Annual data such as inventories and depreciation schedules are submitted at the beginning of each year. Information concerning income, expenses, crop yields, and livestock births is reported on forms mailed monthly to the processing center at the College. Each transaction is then assigned a numerical code and punched on a data processing card. Summaries of these transactions are provided each quarter to each cooperator and an individual analysis is prepared from all the data collected from each farm to the reporting farmer after the end of the year.

While data regarding each individual farm is confidential, the information reported in this report was compiled from averages of various groupings of the cooperating farms.

## GENERAL OBSERVATIONS

Returns to resources on the farms included in this report were generally favorable in 1965. The 190 farms in this report realized an average management return of \$5643. This is what was "left over" after the farmer and his family were "paid" \$300 per month for their labor and capital used in the farm business was "paid" 5% interest. In checking the management return realized on 160 farms in 1964 and 140 farms in 1963, the comparable figures are -\$2396 and -\$831, respectively. The negative figures indicate that in those years, farm earnings were not sufficient to "pay" labor and capital used in the business at going rates.

Average net cash income of the 1965 group was below that of the 1963 and 1964 groups, however, as considerable spending for inventory increase items took place in 1965. Net cash incomes for 1964 and 1965 were \$7,959 and \$6,681, respectively. But the returns to labor, capital and management, which includes an adjustment for inventory change were \$11,938 and \$21,240 for 1964 and 1965, respectively. Most of the inventory increase during 1965 can be accounted for in purchases of new machinery, increased livestock numbers and value, and increased quantities of feed and forage on hand at the end of the year.

It should be stated that the farms included in this report are not a representative sample of Nebraska farms, but are typical of the larger, more commercialized family farms which are increasing in number while total farm numbers are decreasing in Nebraska. Average capital use on these 190 farms in 1965 was \$222,000, which earned at the rate of 7.5%. Seventy-eight of these farms grew irrigated corn, averaging 101 bushels per acre. Labor use averaged 23.6 months per farm, nearly two man-years. Gross income averaged \$59,320. Value of crop production per farm averaged \$27,941 and livestock production was valued at \$30,649.

Loans and accounts receivable included in this report are those of the operator only. The "Loan Ratio", or loans as a percent of investment, is a total farm figure however, in which the landlord's investment is included. Thus, 100% equity of the landlord has been assumed.

Approximately 60% of the farms included in this 1965 report were included in the 1964 summary. Thus as a result of an increase in the number of cooperating farms and a turnover of cooperators, the 1965 group is somewhat different, and larger than the 1964 one.

## DEFINITIONS AND TERMS USED IN THIS REPORT

Averages of individual items in this report are the result of dividing by only the number of farms in which that individual item appeared. The number of farms is shown in parenthesis beside the averaged figure. For example, if there were 20 farms in a group, but only 10 raised corn, the average corn acreage would be computed for 10 farms, not 20. If each farm had 100 acres of corn, the average would appear as 100 (10), indicating that 10 farms had corn, averaging 100 acres each.

INCOME includes income from all sources, including sales of capital items. Two totals are given: Cash Operating Income, and Total Cash Income. The difference between these totals is the value of capital items sold. Machinery, equipment, and real estate are treated as capital items. Breeding livestock is not treated as a capital item in this report.

EXPENSE includes all expenses, including capital purchases. Totalling is parallel to that of the income section. The farm share of personal auto and utility expenses is included at the percentage which each farm operator specified.

LOAN SUMMARY shows the amount of the operator's loans and accounts receivable as of January 1 each year. The "loan ratio" is the operator's loans as a % of total farm investment.

### FINANCIAL SUMMARY

Net Cash Balance is the difference between Total Cash Income and Total Cash Expense plus the value of landlord's crop production if landlord's income had not been reported.

"Plus Inventory Change" is the Net Cash Balance plus inventory change which occurred during the year. This change could be positive or negative.

"Plus Home Used Products" is the immediately preceding figure plus the value of milk, eggs, meat, garden products and other farm produced perquisites used by the family or given away.

"Plus Interest Paid" is the immediately preceding figure plus interest payments made during the year. It is added here to allow comparison of farms which use borrowed funds with those which use internal financing.

Labor Management and Capital Return is the figure arrived at by the immediately preceding steps. It is, as the name implies, the return to unpaid operator and family labor, managerial efforts, and capital invested in the business.

Capital and Management Return is computed by deducting an arbitrary charge of \$300 per month for unpaid operator and family labor from the above figure.

Percent Return on Investment is computed by dividing the Capital and Management Return by Capital managed in the business. The latter figure is: Average Inventory + (.6 x Total Operating Expenses) - (.2 x Total Operating Income). Thus, it is the total of investment capital and operating capital used by the farm.

Labor and Management Return is the result of deducting an arbitrary charge of 5% for capital required by the business from Labor, Management and Capital Return.

Management Return is the residual after a charge for unpaid operator and family labor has been deducted from Labor and Management Return. This figure is "what is left" after the operator has been paid \$300 per month for his labor and 5% interest has been paid on all capital used in the business. We might say that this is the return to the operator for his management efforts. A negative Return to Management indicates that there were insufficient returns to pay the operator that wage and capital that rate of interest.

INVENTORY SUMMARY includes the value of all farm assets on the farm as of January 1 each year. Land is included at present market value. Machinery, equipment, and buildings are included at their depreciated value. Standard declining balance depreciation rates of 20% for machinery and equipment and 10% for buildings were used.

"Net" inventory figures are the result of deducting encumbrances from the value of "Total" inventory figures. These are actually farm "net worth" figures.

NET LIVESTOCK PRODUCTION is the value added to all classes of livestock on the farm during the year, taking into account purchases, sales, inventory change and home use.

"Livestock Production per \$100 Feed Fed" is the total value of net livestock-production divided by the value of feed fed in hundreds of dollars. This is a gross measure of livestock efficiency and is relevant only on farms on which a considerable portion of the gross production is derived from livestock.

CROP ACREAGE SUMMARY includes a summary of irrigated, non-irrigated, and non-tillable land use, by acreage of individual crops.

CROP YIELD SUMMARY shows the average yields of certain crops in bushels or tons per acre.

#### COMPARATIVE FACTORS

Gross Production is an estimate of all value added on the farm during the year. It is the sum of total net livestock production plus the total value of crop production.

Gross Production Per \$100 Invested is the figure immediately above divided by average investment in hundreds of dollars. It is a measure of capital turnover in the business.

Gross Production Per Man is Gross Production divided by the number of full-time man equivalents of labor used. It is a measure of labor efficiency.

Machinery Investment Per Crop Acre is the average of opening and closing investment in machinery divided by the number of crop acres.

Machinery Cost Per Crop Acre is the sum of depreciation, repairs, fuel, oil, interest on investment in machinery (8%), and custom work hired less custom work and trucking income and tax refunds divided by total crop acres.

Fertilizer & Chemical Cost per Crop Acre is the total of fertilizer and chemical purchases, less sales of these products, divided by total crop acres.

Farm Size Index indicates the total resource use of the farm business. It is the sum of 5% times the average investment in the business, \$300 times the months of operator and family labor used, and the value of hired labor used. It permits a size of business comparison across different types of farms and various qualities of land to the extent that price reflects productivity.

## AVERAGES BY AREA

NEBFARM areas are laid out as shown on the above map. The number of farms in each area included in this report are shown in parenthesis in each column of Table I. Due to the small number of farms in area zero, no averages are shown for that area. Due to the similarity of farms and the small number of farms enrolled in areas 3, 5, and 6, these areas were grouped for averaging. Tables Ia and Ib compare income, expenses, loans, financial summary items, inventories, net livestock production, crop acreages, crop yields, and comparative analysis factors between areas. Table II is an abbreviated summary with each of four areas broken down into high and low sub-groups according to rate of return on investment.

Averages of Area 1, the sandhills area, reflect the performance of ranching and combination ranching-farming-feeding operations. Farms in this area averaged largest in terms of farm size index, labor use, and total acreage, averaging 2519 acres each. Gross production per \$100 invested, a measure of capital turnover, was typically low for this area at \$23. This area averaged the highest in machinery investment per crop acre, primarily due to small crop acreage in relation to the total size of operation.

Relatively few farms were averaged in Area 2. One-half of them had some irrigated acreage in 1965, averaging second highest irrigated corn yield when compared with other areas.

Areas 3, 5, and 6 are composed primarily of the transition area. Gross production on farms averaged in these areas is typically about 2/3 from livestock production.

Area 4 covers the central Platte Valley. Farms averaged in this area realized the highest rate of return on investment as compared to other areas in 1965. Machinery, power, and fertilizer costs per acre reflect to some extent the intensive nature of farming in this area. Thirty of the 35 farms in this area grew irrigated corn, averaging 109.9 bushels per acre on an average acreage of 214 acres per farm.

One-half of the farms in Area 7 had some acreage irrigated in 1965, with the value of crop production contributing slightly over 1/2 of the gross production on these farms.

Farms in Area 8 were smallest in terms of total acreage, as compared to those in other areas. Farms in this Northeast Nebraska area were typically livestock-oriented. Favorable livestock prices in 1965, particularly for hogs, helped earn farmers in this group an average return of 8.3% on their investment.

Returns from livestock in 1965 also helped farmers in the Area 9 group earn an average of 8.3% return on their investment. Eighteen Farms in this area had an average value of swine production of \$19,000 in 1965.

## AVERAGES BY FARM SIZE

Increasing farm size has become a recognized trend on today's agricultural scene. How do larger farms compare in operating efficiency with smaller ones? The following tables provide some gross comparisons between groups of small and large farms. Farm size index (computation of this index explained on page 5) was the criterion used when forming the size groups. Detailed reporting of average income, expense, loans, financial summary items, inventories, net live-stock production, crop acreage, crop production, and comparative analysis factors are shown for each size group in Tables IIIa, IIIb. An abbreviated summary of high and low return sub-groups is shown in Table IV. There were an insufficient number of farms in the small size group to enable a breakdown into high and low sub-groups. Rate of return on investment was used as the criterion for defining the low and high return sub-groups.

The table below shows the location by area of the farms in each size group.

Size Group	Area									
	0	1	2	3	4	5	6	7	8	9
Under 9,000	-	1	-	1	-	-	3	8	3	2
9-13,000	2	5	3	1	6	-	1	8	13	10
13-17,000	2	7	2	2	11	1	-	1	15	7
17-25,000	1	-	4	3	12	1	1	8	8	4
Over 25,000	-	7	1	-	6	1	2	4	5	5

Large farms have a greater income producing capacity than small farms. However, larger farms will produce more income only if properly organized and managed. A comparison of two sub-groups from Table IV provides an illustration:

<u>Size &amp; Return Group</u>	<u>Capital Managed</u>	<u>Labor &amp; Management Return</u>
9-13,000 - High	\$130,000	\$16,454
Over 25,000 - Low	480,000	-14,940

The two cases presented here are extremes, but they point out that larger farms do not necessarily produce larger incomes.

## AVERAGES BY FARM TYPE

Farms were classified into various types based on the percentage of "gross production" produced from individual livestock enterprises. The criteria used for the type classes were:

- BEEF RAISING = If over 40% of Gross Production from Beef Raising.
- BEEF FEEDING = If over 40% of Gross Production from Beef Feeding.
- DAIRY = If over 40% of G.P. from Dairy cattle and products.
- SWINE = If over 40% of Gross Production from Hog production.
- BEEF SWINE = If over 40% of G.P. from Beef and Hogs, but neither beef nor hogs provided 40% individually.
- BEEF-DAIRY = If over 40% of G.P. from Beef and Dairy, but neither beef nor dairy produced 40% individually.
- GENERAL LIVESTOCK = If over 35% of G.P. from Livestock but the farm could not qualify for a specific livestock class.
- CROP FARMS = If less than 35% of G.P. from Livestock. This group was sub-divided into Feed Grain-Forage and Cash Crop farms, based upon which type of crops predominated. There were an insufficient number of cash-crop farms for averaging in 1965.

Averages for livestock farm groups are in Tables Va and Vb. Averages for feed grain and forage farms are in Tables VIa and VIb.

The table on page 19 shows the location, by area, of farms making up each type of farm group.

When comparing the value of livestock production per \$100 feed fed between types of farm groups, one should keep in mind that this factor is only a gross measure of livestock efficiency. "Feed Fed" is a residual after sales and closing inventories have been deducted from the total feed supply available for an individual farm. Livestock production per \$100 feed fed was inflated slightly in 1965 by the purchasing and reselling of sealed feed grains, as selling at a price above the purchase price tended to reduce the feed fed item, and increase livestock production per \$100 feed fed.

The effect of favorable hog prices in 1965 is apparent when comparing the swine farms with other groups. The beef raising and dairy farms apparently were at the low end of the income scale when comparing the livestock groups presented in Tables Va and Vb.

According to the farm type categories listed above, the feed grain and forage farms had less than 35% of their gross production from livestock and were primarily engaged in growing feed crops. The 25-50% and over 50% irrigated groups shown in Tables VIa and VIb are concentrated in NEBFARM areas 4 and 7, and reflect the intensive irrigated agriculture of crop farms in the Platte Valley of Nebraska. It is interesting to note that on these farms which have relatively little livestock, income was higher on the more intensively irrigated groups.

## AVERAGES BY PERCENT OF CROPLAND IRRIGATED IN 1965

Farms which had no cropland irrigated in 1965 are averaged according to area, size, and return on investment in Table VIIa and VIIb. Farms which had cropland irrigated in 1965 are averaged in Tables VIIIa and VIIIb according to percent of cropland irrigated, area, and return on investment.

The table below shows the location, by area, of farms included in the non-irrigated and irrigated groups.

	Area									
	0	1	2	3	4	5	6	7	8	9
<u>Non-Irrigated</u>										
Central & Western Nebraska-All	2	7	4	2	2	3	5			
Eastern Nebraska										
Size index under 9,000								5	3	2
Size index 9-13,000								6	11	10
Size index 13-17,000									15	8
Size index 17-25,000								1	6	4
Size index Over 25,000									4	4
