Issued in furtherance of Cooperative Extension work, Acts of May 8 and June 30, 1914, in cooperation with the U.S. Department of Agriculture. Leo E. Lucas, Director of Cooperative Extension Service, University of Nebraska, Institute of Agriculture and Natural Resources.

NEBRASKA WHEAT PRODUCTION

The following data were obtained from Nebraska Agricultural Statistics. Acreages and yield averages include both spring and winter wheat. Separate reports series for spring and winter wheats began in 1909 and were discontinued in 1962.

Year	Planted 000 acres (hectares)	Harvested 000 acres (hectares)	Average yield bu/A (kg/ha)
1866	----	43 (17)	14.0 (942)
1870	----	170 (69)	11.5 (773)
1880	----	1520 (616)	8.5 (572)
1890	----	1775 (719)	12.0 (807)
1900	----	2750 (1114)	14.7 (989)
1910	----	2885 (1168)	15.8 (1063)
1920	3883 (1573)	3593 (1455)	16.8 (1130)
1930	4077 (1651)	3974 (1609)	18.8 (1264)
1940	3278 (1328)	2643 (1070)	13.1 (881)
1950	4346 (1760)	4051 (1641)	21.8 (1466)
1960	3306 (1339)	3011 (1219)	28.5 (1917)
1961	3339 (1352)	3220 (1304)	24.5 (1648)
1962	3060 (1239)	2760 (1118)	19.5 (1312)
1963	3244 (1314)	2815 (1140)	21.5 (1446)
1964	3147 (1275)	2871 (1163)	24.5 (1648)
1965	3273 (1326)	2727 (1104)	20.0 (1345)
1966	2980 (1207)	2860 (1158)	35.0 (2354)
1967	3520 (1426)	3265 (1322)	26.5 (1782)
1968	3240 (1312)	3070 (1243)	32.0 (2152)
1969	2910 (1179)	2650 (1073)	31.5 (2119)
1970	2565 (1039)	2410 (976)	38.0 (2556)
1971	2539 (1028)	2434 (986)	42.0 (2825)
1972	2742 (1111)	2509 (1016)	37.0 (2489)
1973	2800 (1134)	2680 (1085)	35.0 (2354)
1974	3000 (1215)	2900 (1175)	34.0 (2287)
1975	3200 (1296)	3070 (1243)	32.0 (2152)
1976	3400 (1377)	2950 (1195)	32.0 (2152)
1977	3300 (1337)	2950 (1195)	35.0 (2354)
1978	2900 (1175)	2550 (1033)	32.0 (2152)
1979	3000 (1215)	2550 (1033)	34.0 (2287)
1980	3200 (1279)	2850 (1154)	38.0 (2556)
1981	3100 (1256)	2900 (1175)	36.0 (2421)
1982	3100 (1256)	2900 (1175)	35.0 (2354)
1983 ^{1/}	2850 (1154)	2300 (932)	43.0 (2892)

^{1/} August 1 estimate.

ACKNOWLEDGEMENT

This circular is a progress report of variety trials conducted by the Agricultural Experiment Station. Trials were conducted by personnel of the Agronomy Department and the Northeast, South Central, North Platte and Panhandle Stations and their associated field and agricultural laboratories. Tests were supported in part by fees paid by entrants of private varieties or hybrids. Conduct of experiments and publication of results is a joint effort of the Agricultural Experiment Station and the Cooperative Extension Service. Special acknowledgment is made to farmer cooperators who furnished land for experiments; also to County Agents and others who assisted in conduct of tests; also to J. H. Hatchett, A.R.S., USDA Entomologist at Kansas State University for furnishing Hessian fly data.

NEBRASKA VARIETAL TESTS OF FALL-SOWN SMALL GRAINS 1983

This circular is a progress report of winter wheat and winter barley variety trials conducted throughout Nebraska. Entries included varieties or hybrids and promising experimental strains from breeding programs of the Nebraska and other Experiment Stations and private breeders. This was the fourth year for privately developed entries. The state has been divided into eight districts for purposes of variety testing. Locations of these districts and the 1982 variety tests are shown on the map (Page 3).

Trials were located on Experiment Stations and private farms. Names of cooperators and dates of planting and harvest are shown in Table 1. Soil type, soil test data and fertilizer applications are shown in Table 2. Plot sizes varied with location. Drill strips were used in Saunders, Clay and Lincoln Counties. Nursery type plots 6 rows wide and 15 to 35 feet long were planted at other locations. Plots were replicated 4 to 6 times.

Wheat was seeded under favorable conditions in the fall of 1982. Rains delayed seeding in some areas. In mid-October, soil moisture was adequate over the entire state. Fall growth was good. In early December, the crop condition was rated the best since 1972.

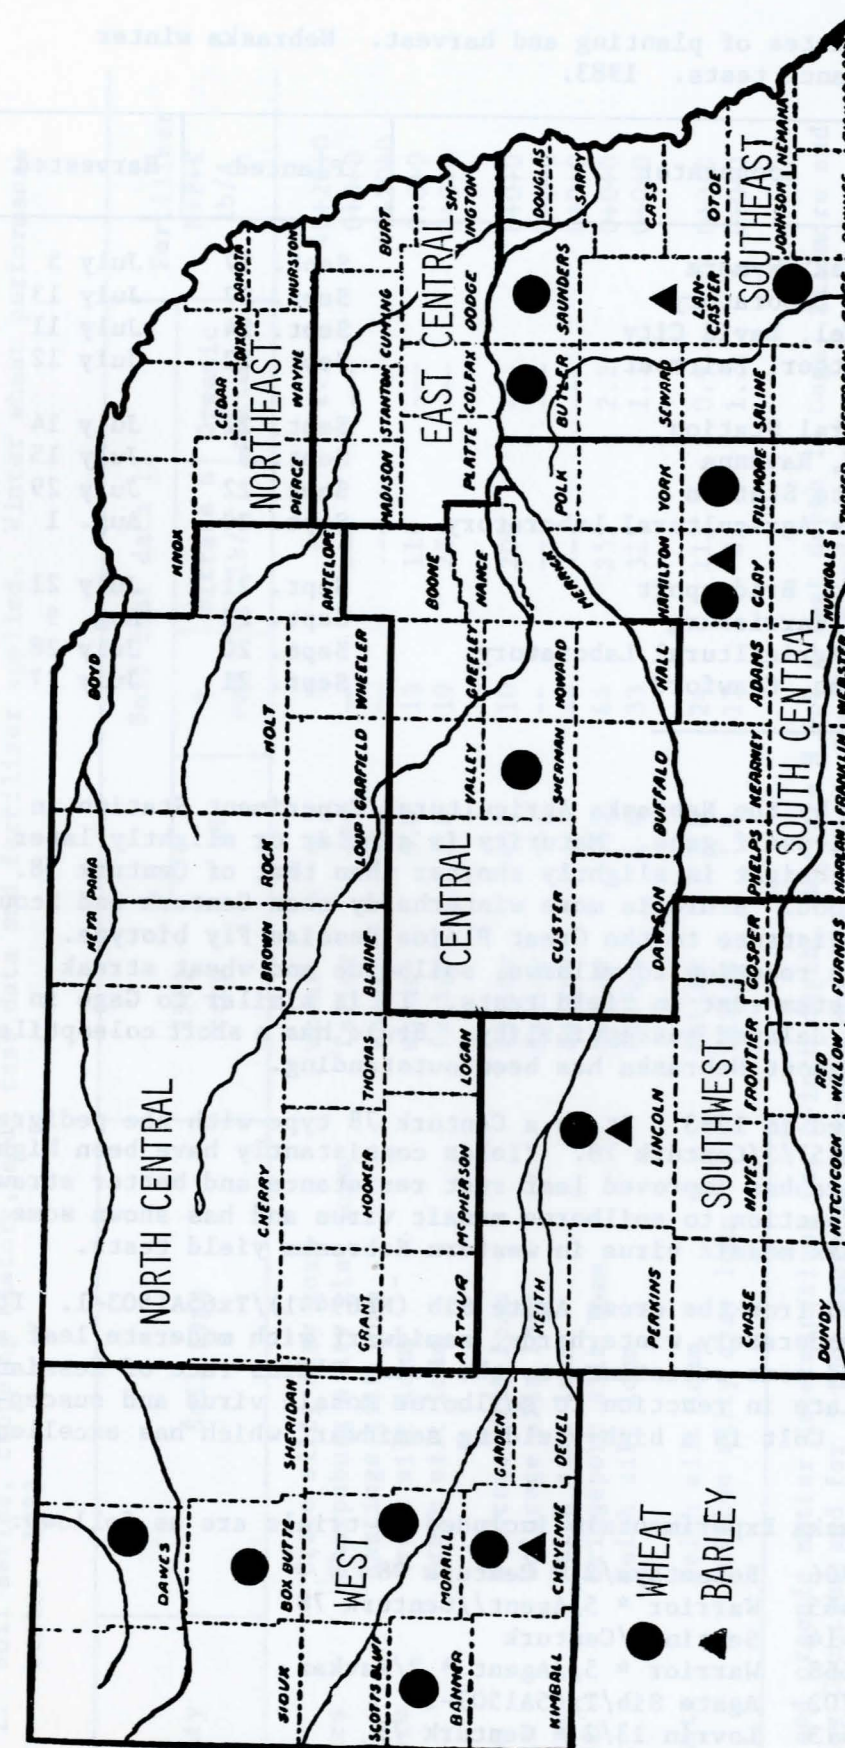

Winter rains and snow cover were favorable. Some icing caused local and spotted winterkill in the east. Otherwise, survival was good with minimal wind damage.

Precipitation in March, April and May was above normal. Cool weather slowed crop development. Low temperatures in the Panhandle caused leaf damage. June weather conditions were favorable. The crop headed a week to ten days later than normal. Growing conditions combined with storms before harvest caused excessive lodging in many areas. Harvest was nearly two weeks later than normal. The final yield of 43 bushels per acre was a new record for Nebraska.

Winter Wheat Varieties

The State-Federal division of Agricultural Stations makes an annual survey of wheat varieties planted. The ten-year summary of Nebraska data is shown in Table 3. This gives an indication of changes in popularity of varieties over years. Acreages of some varieties are concentrated in specific areas while others such as Centurk and Scout 66 are widely distributed.

Characteristics of Experiment Station releases included in current Nebraska tests are shown in Table 4. These characteristics are applicable to varieties when grown in their area of adaptation. When taken out of their area of adaptation, varieties may have different maturity, winterhardiness, or straw strength ratings. Several varieties adapted in western Nebraska have poor straw when grown in eastern Nebraska under more humid conditions. Races of rust and other diseases are under constant change. Varieties which in the past were resistant to stem rust are now susceptible. As rust races change, presently resistant varieties may become susceptible.

NEBRASKA CROP TESTING DISTRICTS AND LOCATIONS OF 1983
WINTER WHEAT & WINTER BARLEY VARIETY TESTS.

Table 1. Location and dates of planting and harvest. Nebraska winter wheat performance tests. 1983.

County	Cooperator	Planted	Harvested
Gage	Ernest Cacek, Wymore	Sept. 17	July 5
Saunders	Mead Field Laboratory	Sept. 27	July 13
Butler	Marvin Andel, David City	Sept. 24	July 11
Fillmore	Robert Bettger, Fairmont	Sept. 22	July 12
Clay	South Central Station	Sept. 22	July 14
Sherman	Henry Habe, Ravenna	Sept. 9	July 15
Lincoln	North Platte Station	Sept. 22	July 29
Cheyenne	High Plains Agricultural Laboratory	Sept. 20	Aug. 1
Morrill	Monty Ogard, Bridgeport	Sept. 21	July 21
Banner	Jack Holt, Harrisburg	Sept. 22	Aug. 9
Box Butte	Northwest Agricultural Laboratory	Sept. 20	July 28
Dawes	J.D. Hartman, Crawford	Sept. 21	July 27

Brule was released by the Nebraska Agricultural Experiment Station in 1982. It carries a semi-dwarf gene. Maturity is similar or slightly later than Centurk 78. Plant height is slightly shorter than that of Centurk 78. Lodging resistance is good. Brule is more winterhardy than Centurk and Scout type wheats. It has resistance to the Great Plains Hessian Fly biotype. Brule is intermediate in reaction to mildews, soilborne and wheat streak mosaic viruses, and to stem rust in field tests. It is similar to Gage in leaf rust reaction with delayed susceptibility. Brule has a short coleoptile. Yield performance throughout Nebraska has been outstanding.

Centura was released in 1983. It is a Centurk 78 type with the pedigree Warrior * 5/Agent//NE68457/3/Centurk 78. Yields consistantly have been higher than Centurk 78. Centura has improved leaf rust resistance and better straw. It is intermediate in reaction to soilborne mosaic virus and has shown some tolerance to wheat streak mosaic virus in western Nebraska yield tests.

Colt is a selection from the cross Agate Sib (NE69441)/Tx65A1503-1. It is a medium maturity, moderately winterhardy, semidwarf with moderate leaf and stem rust resistance and some resistance to the Great Plains race of Hessian Fly. Colt is intermediate in reaction to soilborne mosaic virus and susceptible to wheat streak. Colt is a high-yielding semidwarf which has excellent winter-hardiness.

Pedigrees of Nebraska Experimentals included in trials are as follows:

NE76706	Bezostaya/2 * Centurk 78
NE77465	Warrior * 5/Agent//Centurk 78
NE78414	Sentinel/Centurk
NE78668	Warrior * 5//Agent * 2/Kavkaz
NE78702	Agate Sib/Tx65A1503-1
NE80413	Lovrin 13/2 * Centurk 78
NE80431	NE69613/Sage

Seed of these is not available for general farm planting.

Table 2. Soil series, cropping history, soil test data and fertilizer applied. Winter wheat performance tests. 1983.

County	Soil type	1982 crop	Soil test data 1/				Fertilizer N+P+K lb/A
			pH	P ppm	Nitrate N lb/A	Organic matter %	
Gage	Crete silty clay loam	wheat	6.5	7	62	2.5	40+20+0

Vona	Early	Poor	Medium	Excellent	MR	S	MR	S

^{1/} Experiment Station varieties. Contact the originator for information on Agripro, Bounty Hybrid, Garst Seed, HybriTech, Migro, NK ProBrand, Rohm & Haas and Seed Research entries. When varieties are taken out of their adapted area, relative maturities, straw strength and other characteristics are subject to variations. Abnormal disease or insect infestations also cause differences in expression of plant characteristics.

^{2/} R = resistant, S = susceptible, MR = moderately resistant, MS = moderately susceptible.

Privately developed winter wheats were included in the 1983 trials. Developers and entries were as follows:

North American Plant Breeders Box 30 Berthoud, CO 80513	Agripro Hawk, Rocky, Wings; Migro Archer
Cargill Incorporated 2540 E. Drake Rd. Ft. Collins, CO 80513	Bounty Hybrid 100, 310
Garst Seed Co. Eminence Route Garden City, KS 67846	Garst Seed HR53, HR64
HybriTech Seed 131 Woodrow Wichita, KS 67203	Hybri Tech 567a, H171
Northrup King Company P.O. Box 918 Norfolk, NE	NK ProBrand 817, 830, 835
Rohm & Haas Company 6025 W. 300 S. Lafayette, IN 47905	Rohm & Haas HW1001, HW1010, HW1020, HW1021, HW1025
Seed Research R.R. 2, Box 48 Scott City, KS 67871	Seed Research Brawny, Citation, 5221, Wx8017

Some of these are varieties, others are hybrids. The entrant should be contacted for information on seed availability, adaptation and agronomic characteristics.

Winter Wheat Performance

Yield and weight per bushel data for locations and/or districts are shown in Tables 5 through 13. Results of 1983 trials are given along with period-of-years data. Data for other characteristics are summarized in tables as follows:

Table 14	Protein, 1983
15	Protein, 1973-1983
16	Kernel weight, 1983
17	Plant height, 1983
18	Flower, lodging and rust reaction, 1983
19	Hessian fly, 1983

Protein, plant height, and kernel weight were determined for all locations. Flowering data were obtained for two locations. Differential lodging was observed at five locations, rust readings at two and Hessian fly at three locations.

Yielding ability of different varieties cannot be measured with absolute accuracy because of variations in soil fertility, moisture, and other factors. For this reason, small differences in yield have no significance. Unless the difference in yield of two varieties is greater than the difference required for significance shown in the tables, little confidence can be placed in the superiority of the one over the other in that particular test. These differences are shown at the 5% level, meaning that differences as large or larger could be expected through chance alone in 1 of 20 trials.

No winter wheat trials were located in Northeast Nebraska in 1983. Results of 1977-1982 trials in this area are shown in Table 5.

Three trials were harvested in the Southeast District (Table 6). In Gage County, severe N deficiency was evident in early spring. Nitrogen fertilizer was applied. Final yields were good with no lodging. Plot variability was higher than desirable. High fertility and heavy growth resulted in excessive lodging in Saunders County. Yields were high. Icing caused loss of many plots in Butler County. No data were obtained for Wings or Colt. This was a position, not variety, effect. Nine varieties had average yields of 60 bushels or more in the average of three trials. Period-of-years averages for Southeast Nebraska are shown in Table 7.

South Central District trials were in Fillmore and Clay Counties (Table 8). In Fillmore County, on continuous cropping, the average yield exceeded 50 bushels per acre. Bushel weights were high with no lodging. In Clay County, on fallow, the average yield exceeded 65 bushels. Entries ranged from 0 to 90% lodged. Nineteen entries had average yields of 60 bushels or more in the two-test average. Scout types ranked low in yield. Period-of-years data for South Central Nebraska are shown in Table 9.

Data for wheat trials in the Central District for the 1978-1983 period are shown in Table 10. Lodging was early and heavy in this area and adversely affected 1983 yields and test weights. Average yields varied greatly with season.

The Southwest District trial was on the North Platte Station in Lincoln County (Table 11). Downy brome infestation was heavy and greatest in semi-dwarf entries. Lodging was severe for many entries. In this area, Centurk 78 and similar types have maintained their good relative yield record.

Five Trials were located in the West District. Average yields by location were as follows: Morrill 45, Cheyenne 61, Banner 61, Box Butte 56 and Dawes 44 bushels per acre. The Morrill County plot was heavily grazed in the spring. Light hail at heading may have affected yields in Cheyenne County. The May 12 freeze delayed development in Banner County. Fertility was high and lodging was severe. The Box Butte County trial had differential leaf damage from the May 12 freeze. This did not seem to affect final yields adversely. Good, but not extremely high, yields were obtained in Dawes County. In the average of five trials in the West District, four varieties produced average yields of 60 bushels per acre or more. Period-of-years data for the Panhandle are shown in Table 13.

Statewide averages give an indication of whether a variety has broad adaptation. Some varieties have wide adaptation and do well over an extended range of conditions. Others are more specific in adaptation and may be included in trials on a limited basis. Often factors other than yield determine specific areas in which a variety does best. Performance of varieties in the Nebraska tests was summarized on the basis of three broad areas: the entire state, the eastern one-half and the western one-half.

Yield data were obtained for 20 entries tested at all 12 locations in Nebraska in 1983. Average yields were as follows: Agripro Hawk 59, Brule 59, NE78702 58, Garst Seed HR64 57, Rohm & Haas HW1010 56, NE78668 56, Dawn 55, Garst Seed HR53 55, Vona 54, Rohm & Haas HW1021 54, Centura 52, NE80413 52, NE76706 52, NE77465 50, Centurk 78 50, Agripro Rocky 49, Rohm & Haas HW1020 49, NE78414 48, Buckskin 46 and Scout 66 42 bushels per acre. Because of an error in seed source, Turkey was not included at all locations in 1983. Colt was planted at all locations, but yield data were lost from one.

Previous high ranking entries and statewide average yields were as follows: 1982 NE78668 46, 1981 TAM 105 57, 1980 TAM 105 58, 1979 Buckskin 49, 1978 Centurk 78 and Centurk 43, 1977 Buckskin, Sage, Larned and Bennett 43, 1976 Bennett 50, 1975 Lindon 50, 1974 Centurk, Sage and Lancota 49, 1973 Sage 47, 1972 Centurk and Buckskin 48, 1971 Centurk 57, 1970 Centurk 52, and 1969 Centurk 42 bushels per acre.

In an average of five tests on eastern Nebraska, 28 varieties and hybrids had average yields as follows: NE78668 65, Bounty Hybrid 310 65, Brule 65, Bounty Hybrid 100 64, Dawn 63, Agripro Hawk 62, NE78702 60, Migro Archer 60, Garst Seed HR64 59, Rohm & Haas HW1021 59, Arkan 58, Rohm & Haas HW1010 58, Centura 57, Vona 57, Garst Seed HR53 57, NE76706 56, Agripro Rocky 55, Rohm & Haas HW1025 55, NE77465 55, Rohm & Haas HW1020 53, NE80413 53, Centurk 78 53, Lancota 51, Larned 50, NE78414 49, Bennett 49, Scout 66 47, and Buckskin 46 bushels per acre. All locations had average yields of 50 bushels or more.

Many of the same varieties were included in the Central, Southwest and West Cropping Districts. The average 1983 average grain yield of 23 entries included in eight tests was as follows: NE78702 56, Agripro Hawk 56, Garst Seed HR64 55, Rohm & Haas HW1010 55, Brule 54, Garst Seed HR53 53, Colt 52, Vona 52, NE80413 50, Rohm & Haas HW1021 50, NE78668 49, NE76706 49, Centura 49, Dawn 48, Rohm & Haas HW1001 48, Centurk 78 48, NE77465 47, NE78414 47, Buckskin 46, Rohm & Haas HW1020 46, Agripro Rocky 45, Scout 66 38 and Turkey 32 bushels per acre. Individual location yields ranged from 33 bushels in Sherman to 61 bushels in Cheyenne and Banner Counties.

Brule was released by the Nebraska Agricultural Experiment Station in 1982. It had an excellent yield record in the 1981-1983 statewide trials. The 1980-1983 seasons did not favor earlier varieties such as Bennett and the Scout types. Winterkilling was a factor in some of the 1980-1982 trials. Cold damage along with other factors reduced yields in Saunders, Clay and Dixon Counties in 1982. Winterkilling was absent or minor in 1983. Centurk 78 had a good yield record in 1980, was only average in 1981 and was below average in 1982 and 1983. Centura has consistently outperformed Centurk 78 in all areas except the Southwest.

Protein data for 1983 are shown in Table 14. Protein content generally was low except for Saunders, Clay, Sherman and Banner counties. Eleven-year protein data are shown in Table 15. To be included in this table, varieties must have been included at all locations for the data year shown.

Seed size data are shown in table 16. Seed size was larger than usual in 1983. This is a reflection of an extended grain-fill period.

Plant height data are reported in Table 17. Flower, lodging, leaf rust and stem rust data are shown in Table 18. Lodging data were obtained from five locations. Lodging was more severe than normal. Stem rust was more widespread and more severe on susceptible varieties than in any season since the mid-1960's.

Hessian fly infestation was determined for Gage, Clay and Sherman Counties (Table 19). Infestation was especially heavy in Gage County. With the advent of varietal resistance, many farmers have tended to ignore potential Hessian fly problems.

Winter Barley

Winter barley variety trials were seeded at four locations. Because of various problems, only the Lancaster County trial was harvested (Table 20). All varieties had good survival. The crop grew tall with heavy lodging. Five-year winter barley data are shown in Table 21. Dundy is a recent release from the Nebraska Agricultural Experiment Station.

THE METRIC SYSTEM

1 centimeter	= 0.394 inches	mm	= inches x 25.4
1 meter	= 39.37 inches	cm	= inches x 2.54
1 hectare	= 2.471 acres	ha	= acres x 0.405
1 kilogram	= 2.205 pounds	kg	= pounds x 0.454
1 hectoliter	= 2.838 pounds	hl	= bushels x 0.352

kilograms/hectoliter (kg/hl) = lb/bu x 1.287
kilograms/hectare (kg/ha) = bu/A x 53.81 (48# bushel)
kilograms/hectare (kg/ha) = bu/A x 67.26 (60# bushel)

Agricultural Research for All of Nebraska

The agricultural research division of the Institute of Agriculture and Natural Resources is the Nebraska Agricultural Experiment Station. The Experiment Station relies on its research centers and field laboratories to provide applied knowledge for development of Nebraska's largest industry—agriculture. In addition, many Nebraska farmers cooperate by furnishing land and other facilities for research projects. This provides information from areas not well represented by stations.

The Cooperative Extension Service transmits data to users through District and County Ex-

tension Offices. Area and County Extension Agents are available to provide additional interpretation and more specific recommendations.

Nebraska is a large state and has great variation due to topography and the continental type of climate. The elevation ranges from 1,000 feet to near a mile high in the northwest portion of the state, rainfall varies from 14 to 40 inches per year, and the soil types vary from sands to heavy clays. The research program thus is broad in subject matter and geography, resulting in the need for various stations and satellite locations.

The Cooperative Extension Service provides information and educational programs to all people without regard to race, color, national origin, sex or handicap.
