NEBRASKA SOYBEAN VARIETY TESTS

January 1991

AUTHORS

L. A. Nelson	Department of Agronomy, Lincoln
R. W. Elmore	South Central Research and Extension Center, Clay Center
R. S. Moomaw	Northeast Research and Extension Center, Concord
G. W. Hergert	West Central Research and Extension Center, North Platte
R. N. Klein	West Central Research and Extension Center, North Platte

ACKNOWLEDGMENTS

This circular is a progress report of soybean variety trials conducted by personnel of the Agronomy Department and the Northeast, South Central and West Central Research and Extension Centers. Conduct of experiments and publication of results is a joint effort of the Agricultural Research Division and the Cooperative Extension Service.

Tests were supported in part by fees collected from entrants. A grant from the Nebraska Soybean Development Utilization and Marketing Board enabled the purchase of planting and harvesting equipment needed for conduct of East Central, Southeast, and South Central trials. Soybean check-off grants also support variety trials conducted by the Soybean Breeding Project and

sprinkler irrigation experiments established by the West Central Research and Extension Center. Acknowledgment is made to farmers who furnished land for experiments; also to extension agents and other I.A.N.R. personnel who assisted with the tests.

This is the second year for the off-station sites in the North Platte area. Bob Klein has made a significant contribution to this year's data with Brown, Furnas, and Lincoln County locations.

The authors wish to recognize the contributions of the technical staff, Patrick Tenopir, John Eis, Ray Brentlinger, Robert Hendrickson, George Hoffmeister, and Don Thrailkill.

METRIC EQUIVALENTS

1 centimeter	= 0.394 inches	cm	= inches x 2.54
1 hectare	= 2.471 acres	ha	= acres x 0.405
1 kilogram	= 2.205 pounds	kg	= pounds x 0.454
1 hectoliter	= 2.838 bushels	hl	= bushels x 0.352

Kilogram/hectare (kg/ha) = bu/A x 67.26 (60# bushel)

NEBRASKA SOYBEAN PRODUCTION

The following data were obtained from Nebraska Agricultural Statistics.
In 1940, 13,000 acres of soybeans also were cut for hay.

Year	Harvested acres (ha) 000	Average yield bushels (kg/ha)	Production bushels (metric tons) 000
1940	4 (2)	14.0 (942)	56 (2)
1950	50 (20)	24.0 (1614)	1,200 (33)
1955	180 (73)	10.5 (706)	1,890 (51)
1956	146 (59)	11.5 (773)	1,679 (46)
1957	142 (58)	26.0 (1749)	3,692 (101)
1958	206 (83)	29.0 (1951)	5,974 (163)
1959	146 (59)	24.0 (1614)	3,504 (95)
1960	164 (66)	28.0 (1883)	4,592 (125)

NEBRASKA SOYBEAN VARIETY TESTS

1990

The 1990 estimated soybean yield for Nebraska was 34 bushels per acre from 2,350,000 harvested acres. The yield was low because of the hot dry summer but was better than the two previous years. The total production of soybeans for the state was 79,900,000 bushels.

The crop was planted behind schedule because of low temperatures and

some precipitation. The growing season was slightly behind normal because of drought and the later planting. Hot, dry conditions in late August and early September were causing fields to turn color and drop leaves and pods. This heat interfered with pod filling as it forced maturity. Harvest was ahead of schedule because of the hot, dry weather in the latter part of the summer and early fall.

PROCEDURE

Data were obtained from 15 trials at 9 locations (Table A). Publicly-released entries were included at all sites. Privately developed varieties or blends were included in trials at all locations. Privately developed varieties were selected by the seed supplier. At many locations, entries were divided into early and late maturing varieties for convenience in handling. A list of entries by brand name is shown in Table B. Names and addresses of entrants are shown in Table C.

Entries usually were planted in four-row plots 15 to 35 feet long. Plots were replicated four times in a randomized complete block design. A planting rate of 8.5 seeds per foot in 30-inch rows (148,100 seeds per acre) was used unless a higher or lower rate was requested by the entrant. Hobbit, Hoyt and Ripley were planted at a 13 seeds per foot rate.

At harvest, two rows 10 to 30 feet long were threshed for yield. Reported yields are corrected to 13% moisture. Plots were rated mature when 95% of the pods that have reached their mature pod color. Five to ten days of drying weather are required after "maturity" before the soybeans have less than 15% moisture.

Plant height is the average length in inches of plants from the ground to the tip of the main stem at the time of maturity. Lodging is rated at maturity according to the following scores: 1 = Almost all plants erect, 2 = All plants leaning slightly, or a few plants down, 3 = All plants leaning moderately (45%), or 25% to 50% of the plants down, 4 = All plants leaning considerably, or 50% to 80% of the plants down, 5 = Almost all plants down. Seeds per pound data are reported for most locations. Protein and oil content were obtained at many locations in 1990. These are reported on a 13% moisture basis and will appear lower than many reported figures. Conversions can be made to 0% by multiplying the protein or oil by 1.15. Estimated Processed Value (EPV) is calculated from the protein and oil content and the January, 1990 Chicago Board of Trade futures prices for soybean oil (\$0.193/lb.) and 44 percent protein soybean meal (\$183.10/ton) on Sept. 1 1989. EPV is calculated on an acre basis by multiplying the yield (bu/acre) times the EPV/bu. The University of Nebraska Soil Testing Lab did the protein and oil content analyses and we thank them for their cooperation.

PERFORMANCE

Entries generally are listed in tables in order of decreasing yield. Average performance of varieties included in trials for five years in each area is shown in Table D. These data give an indication of year effects on yield, maturity, lodging, plant height and seed size. From these data, it is quite apparent that the heat and the dry conditions in the fall had an effect on yield and seed size of the non irrigated locations.

Performance of entries cannot be measured with absolute accuracy because of variations in moisture, soil fertility and other factors. For this reason small yield differences have little significance. Differences required for significance are shown in each table at the 5% and 25% levels. This means that differences this

great would be expected through chance alone in 1 of 20 or 1 of 4 trials, respectively. A simple way of thinking of these differences is that if all the plots had been the same variety, that would be the difference that would have been measured. Many soybean varieties have similar yield potentials. Early-maturing varieties are favored in some seasons and later-maturing varieties in others. Period-of-years averages provide a measure of performance over a range of environmental conditions.

Period-of-years data for varieties included for two-, three-, four-, and five-years are reported. When comparing varieties, it is important to observe their performance for more than one year. Comparisons are best if they are done over the largest possible number of years.

RESULTS AT INDIVIDUAL LOCATIONS

Northeast (Tables 1A and 2A)

Both early and late maturing varieties were planted in Dixon County. The growing season in the Northeast region was normal with adequate moisture most of the summer but some periods of drought stress.

East Central (Tables 3A & 4A)

Both early and late maturing varieties were planted in Saunders County. Yields were lower than last year and the seed/pound were higher indicating smaller seed. This year also showed earlier maturity dates. The heat and dry weather in the last two weeks of August, and first two weeks of September hurt the yields and seed size and caused earlier maturity.

Southeast (Tables 5A & 6A)

Both early and late maturing varieties were planted in Nemaha County. Good moisture at planting time got the beans off to a good start, but there wasn't much rain after that. Yields and seed size were better this year than last year. The maturity date's were much earlier than last year.

South Central Irrigated (Tables 7A & 8A)

In Clay County the ridge top was shaved off prior to planting with a Buffalo ridge runner. The plot was planted immediately afterwards. Yields and seed size were good at this plot.

The Thayer County field was blank planted with a rotary tiller. The plot suffered some hail damage in late June.

Central Irrigated (Tables 9A & 10A)

Both early and late maturing varieties were planted in Valley County. This plot

had good yields even though it suffered some hail damage in late June.

Southwest Irrigated (Table 11A)

All maturity groups were planted together in one test in Furnas County. The yields were good with plants being quite tall.

West Central Irrigated (Table 12A)

There was no division between early and late maturing varieties in this plot in Lincoln County. The protein percentage and plant height was higher this year but the lodging scores were also higher.

North Central Irrigated (Table 13A)

The early and late maturing varieties

CULTURAL PRACTICES

Dixon: Herbicide used was Treflan at 0.75 lbs./A. Cultivated once.

Saunders: Cropping history: 1988: soybeans 1989: corn. Herbicides used were 2 pts. Prowl PPI and Roundup 75:1 with the bean buggy. Cultivated one time and hand weeded.

Nemaha: Cropping history: 1988: soybeans 1989: milo. Herbicide used 0.5 lb. Preview and 1.5 lbs. Treflan PPI. This test was cultivated one time and hand weeded.

Clay: Previous crop was corn. Herbicides used were Lasso 2 qts./A, Sencor 0.5 lb., Poast 1 pt., and 28% UAN postemergence.

Thayer: Corn for the past two years. Herbicides used were Treflan broadcast and Pursuit used postemergence.

Valley: Corn for the past two years. The field was disked, and fertilizer with Pursuit Plus was applied with a floater. The field

were planted together in this test in Brown County. Yields were up a little at this area compared to last year. Because of its location, this area requires early maturing varieties.

West Central Irrigation Test (Table 14A)

In 1990, 28 soybean varieties were planted under two irrigation regimes in a wheat-sorghum-soybean rotation at the West Central Research and Extension Center in Lincoln County. The year was very dry with rainfall for the period September 1989 through August 1990 4 inches below normal of the longer term average of 19.4 inches. Varieties selected represent a range in maturities from Early Group II to Late Group II's.

was disked twice more and blank planted.

Brown: Corn for the past two years. Herbicides used were 1.4 pts Treflan and 0.35 pts. Scepter. Fertilizer used at preplant was 50 lbs. of 21-0-0-24 and at planting 11.5 lbs. N and 12 lbs. S ammonia sulfate. Soil applied inoculant at planting.

Furnas: Corn for the past two years. Herbicide used was 2 pts. Commence. Soil applied inoculant at planting time.

Lincoln: Cropping history: 1988: corn 1989: popcorn. Herbicide used was 2 pts. Pursuit Plus preemergence. Soil applied Inoculum at planting time.

Lincoln Irrigation: Limited irrigation plots received 6 inches of irrigation while fully irrigated plots received about 11 inches.

AGRICULTURAL RESEARCH AND EXTENSION FOR ALL OF NEBRASKA

The Agricultural Research Division of the Institute of Agriculture and Natural Resources is responsible for studies to broaden our basis of knowledge for agricultural production. Research centers and field laboratories provide applied information for development of Nebraska's largest industry — agriculture.

The Cooperative Extension Service transmits data and provides interpretation to users through Extension Agents and Specialists. Extension Agents may be contacted through 85 local Extension offices for additional information and more specific recommendations.

Nebraska is a large state and has great variation due to topography and the continental type of climate. The elevation ranges from 1,000 feet to near a mile high in the northwest portion of the state, rainfall varies from less than 15 to more than 35 inches per year, and the soil types vary from sands to heavy clays. The research and extension programs thus are broad in subject matter and geography, resulting in the need for various centers, satellite locations, and local offices.
