NEBRASKA SOYBEAN VARIETY TESTS 1991

FEB 28 1992

**University of Nebraska-Lincoln
Institute of Agriculture and Natural Resources
Agricultural Research Division
Cooperative Extension**

Issued in furtherance of Cooperative Extension work, Acts of May 8 and June 30, 1914, in cooperation with the U.S. Department of Agriculture. Kenneth R. Bolen, Director of Cooperative Extension, University of Nebraska, Institute of Agriculture and Natural Resources.

EXTENSION CIRCULAR 91-104

NEBRASKA SOYBEAN VARIETY TESTS

January 1992

AUTHORS

L. A. Nelson	Department of Agronomy, Lincoln
R. W. Elmore	South Central Research and Extension Center, Clay Center
R. S. Moomaw	Northeast Research and Extension Center, Concord
R. N. Klein	West Central Research and Extension Center, North Platte

ACKNOWLEDGMENTS

This circular is a progress report of soybean variety trials conducted by personnel of the Agronomy Department and the Northeast, South Central and West Central Research and Extension Centers. Conduct of experiments and publication of results is a joint effort of the Agricultural Research Division and the Cooperative Extension Service.

Tests were supported in part by fees collected from entrants. A grant from the Nebraska Soybean Development Utilization and Marketing Board enabled the purchase of planting and harvesting equipment needed for conduct of East Central, Southeast, and South Central trials. Soybean check-off grants also support variety trials conducted by the Soybean Breeding Project and sprinkler irrigation experiments established by the West Central Research and Extension Center. Acknowledgment is made to farmers

who furnished land for experiments; also to extension agents and other I.A.N.R. personnel who assisted with the tests.

Beginning in 1991, zones were redrawn to better reflect maturity zones. All zones have at least two testing sites which are averaged in the tables for that zone. Because of this change, some period of years averages will not reflect all entries in that zone. The reason is the varieties entered in two tests were different in previous years.

The authors wish to recognize the contributions of the technical staff, Patrick Tenopir, Tom O'Hare, John Eis, Ray Brentlinger, George Hoffmeister, and Don Thrailkill, Robert Hendrickson. We also wish to acknowledge the assistance of the Nebraska Agricultural Statistics Service and the State Climate Program of the University of Nebraska.

METRIC EQUIVALENTS

1 centimeter = 0.394 inches	cm = inches x 2.54
1 hectare = 2.471 acres	ha = acres x 0.405
1 kilogram = 2.205 pounds	kg = pounds x 0.454
1 hectoliter = 2.838 bushels	hl = bushels x 0.352

Kilogram/hectare (kg/ha) = bu/A x 67.26 (60# bushel)

NEBRASKA SOYBEAN PRODUCTION

The following data were obtained from Nebraska Agricultural Statistics.

In 1940, 13,000 acres of soybeans also were cut for hay.

Year	Harvested acres (ha) 000	Average yield bushels (kg/ha)	Production bushels (metric tons) 000
1940	4 (2)	14.0 (942)	56 (2)
1950	50 (20)	24.0 (1614)	1,200 (33)
1955	180 (73)	10.5 (706)	1,890 (51)
1956	146 (59)	11.5 (773)	1,679 (46)
1957	142 (58)	26.0 (1749)	3,692 (101)
1958	206 (83)	29.0 (1951)	5,974 (163)
1959	146 (59)	24.0 (1614)	3,504 (95)
1960	164 (66)	28.0 (1883)	4,592 (125)
1961	292 (118)	25.5 (1715)	7,446 (203)
1962	310 (126)	27.0 (1816)	8,370 (228)
1963	356 (144)	28.5 (1917)	10,146 (276)
1964	523 (212)	22.0 (1480)	11,506 (313)
1965	696 (282)	23.5 (1581)	16,356 (446)
1966	745 (302)	29.5 (1984)	21,978 (599)
1967	782 (317)	22.5 (1513)	17,595 (479)
1968	782 (317)	23.5 (1581)	18,377 (501)
1969	766 (310)	33.5 (2253)	25,661 (699)
1970	812 (329)	22.0 (1480)	17,864 (487)
1971	609 (247)	25.0 (1682)	15,225 (415)
1972	746 (302)	33.0 (2220)	24,618 (671)
1973	1,210 (490)	30.0 (2018)	36,300 (989)
1974	1,190 (482)	24.0 (1614)	28,560 (778)
1975	1,200 (486)	27.0 (1816)	32,400 (883)
1976	980 (397)	20.0 (1345)	19,600 (534)
1977	1,300 (458)	36.0 (2421)	40,680 (1108)
1978	1,250 (506)	34.0 (2287)	42,500 (1158)
1979	1,610 (652)	34.0 (2287)	54,740 (1491)
1980	1,770 (717)	30.0 (2018)	53,100 (1446)
1981	2,070 (838)	38.0 (2566)	78,660 (2143)
1982	2,250 (911)	35.0 (2354)	78,750 (2146)
1983	2,070 (838)	28.5 (1917)	58,995 (1607)
1984	2,550 (1033)	26.0 (1748)	66,300 (1804)
1985	2,360 (956)	36.0 (2421)	84,960 (2312)
1986	2,450 (992)	38.0 (2555)	93,100 (2534)
1987	2,350 (952)	35.5 (2388)	83,425 (2270)
1988	2,300 (932)	30.0 (2018)	69,000 (1877)
1989	2,560 (1078)	32.0 (2153)	81,920 (2229)
1990	2,350 (952)	34.0 (2287)	79,900 (2174)
1991 *	2,450 (992)	33.0 (2220)	80,850 (2200)

* November estimate.

NEBRASKA SOYBEAN VARIETY TESTS

1991

The November 1991 estimated soybean yield for Nebraska was 33 bushels per acre from 2,450,000 harvested acres. The yield was lower than last year but the acres harvested were up by 100,000 acres. The total production of soybeans for the state was 79,900,000 bushels. These estimates are from the November Nebraska Agricultural Statistics Service.

The crop started out ahead of 1990, but it fell behind from the rain in June and the replanting of soybean fields where damaged by storms.

Soybean blooming was well ahead of last year and average. Drought-like conditions during the summer were stressed dryland crops and decreased yield potential. The crop matured at a faster pace than 1990. Harvest began a week ahead of last year in some areas. The state received its first killing frost the third week of September. Most crops were mature and the yields were not affected. However, some late planted or replanted crops were hurt. Harvest was completed ahead of schedule.

PROCEDURE

Data were obtained from 16 trials at 9 locations (Table A). Publicly-released entries were included at all sites. Privately developed varieties or blends were included in trials at all locations. Privately developed varieties were selected by the seed supplier. At seven locations, entries were divided into early and late maturing varieties for convenience in handling. A list of entries by brand name is shown in Table B. Names and addresses of entrants are shown in Table C.

Entries usually were planted in four-row plots 15 to 35 feet long. Plots were replicated four times in a randomized complete block design. A planting rate of 8.5 seeds per foot in 30-inch rows (148,100 seeds per acre) was used unless a higher or lower rate was requested by the entrant. Hobbit 87 was planted at a 12 seeds per foot rate.

At harvest, two rows 10 to 30 feet long were threshed for yield. Reported yields are corrected to 13% moisture. Plots were rated mature when 95% of the pods

that have reached their mature pod color. Five to ten days of drying weather are required after "maturity" before the soybeans have less than 15% moisture.

Plant height is the average length in inches of plants from the ground to the tip of the main stem at the time of maturity. Lodging is rated at maturity according to the following scores: 1 = Almost all plants erect, 2 = All plants leaning slightly, or a few plants down, 3 = All plants leaning moderately (45%), or 25% to 50% of the plants down, 4 = All plants leaning considerably, or 50% to 80% of the plants down, 5 = Almost all plants down.

Protein and oil content were obtained at all locations in 1991. These are reported on a 13% moisture basis and will appear lower than many reported figures. Conversions can be made to 0% by multiplying the protein or oil by 1.15. Estimated Processed Value (EPV) is calculated from the protein and oil content and the January, 1990 Chicago Board of Trade futures prices for soybean oil

(\$0.193/lb.) and 44 percent protein soybean meal (\$183.10/ton) on Sept. 1 1989.

EPV is calculated on an acre basis by multiplying the yield (bu/acre) times the EPV/bu. The University of Nebraska Soil Testing Lab did the protein and oil content analyses and we thank them for their cooperation.

Rainfall and temperature data for seven of the nine locations is shown at the end of this circular. The results are listed as deviations from the 30 year averages for that location. We wish to thank the State Climate Program at UN-L for their assistance in obtaining these data.

PERFORMANCE

Entries generally are listed in tables in order of decreasing yield. Average performance of varieties included in trials for five years in each area is shown in Table D. These data give an indication of year effects on yield, maturity, lodging, plant height and seed size.

Performance of entries cannot be measured with absolute accuracy because of variations in moisture, soil fertility and other factors. For this reason small yield differences have little significance. Differences required for significance are shown in each table at the 5% and 25% levels. This means that differences this great would be expected through chance alone in 1 of 20 or 1 of 4 trials, respectively.

A simple way of thinking of these differences is that if all the plots had been the same variety, that would be the difference that would have been measured. Many soybean varieties have similar yield potentials. Early-maturing varieties are favored in some seasons and later-maturing varieties in others. Period-of-years averages provide a measure of performance over a range of environmental conditions.

Period-of-years data for varieties included for two-, three-, four-, and five-years are reported. When comparing varieties, it is important to observe their performance for more than one year. Comparisons are best if they are done over the largest possible number of years.

RESULTS AT INDIVIDUAL LOCATIONS

Northeast (Pages 13-22)

Four tests at two locations were planted in Dixon and Sherman Counties. Dixon County received good rain in May and June. Moderate drought stress in July and August had little effect on yields. Hot weather in August and September matured the soybeans early. Yields at the Sherman County location were excellent considering the dry conditions that prevailed in most of the soybean producing areas of the State. Moisture at the plot was near normal.

Vegetative growth at the plot was lavish which reflected by tall plant heights and high lodging scores. Frost the morning of 19 September ended the growing season. Some late varieties were not fully mature.

East Central (Pages 21-31)

Six tests at three locations were planted in Cass, Clay, and Furnas Counties. Cass County plot received some timely rains that helped yields on this dryland plot. A killing frost the morning of

the 19 September hurt some of the late maturing varieties. In Clay County precipitation in April through September was only 76% of normal. The growing degree days were near normal. The winds and humidity were above normal. There wasn't much stress with irrigation. The plot looked good overall. Wet conditions delayed planting at the Furnas County plot. The irrigated kept the stress down. August 21 was the last irrigation. The supply canal was shut down at that time and ran short of water at the plot.

Southeast (Pages 32-39)

There were four tests at two locations in Nuckolls and Richardson Counties. Nuckolls County was gravity irrigated and the yields were excellent. There was some lodging with the lavish plants. Richardson County was a dryland

plot but by looking at it one would think otherwise. The rains were timely and it showed. The plant height averages for the early and late maturing varieties were over 45 inches. The number of pods on the plants were tremendous. The yields were that of an irrigated plot. There was a killing frost the morning of the 19 September but the soybeans were mature enough that it didn't hurt them.

West (Pages 40-41)

There were two tests at two locations in Brown and Dawson Counties. Wet conditions delayed planting at Brown County. Center pivot irrigation helped get a 45.9 bu/a average yield. The Dawson County plot received eight inches of rain in ten days that flooded the plot and later caused crusting. Ditch irrigation helped this plot get a 56 bu/a average yield.

CULTURAL PRACTICES

Dixon: Previous crop was corn. Herbicide used was Trellan at 0.75 lb/a.

Sherman: Corn for the past two years. Fertilizer used was 100 lb 10-34-0, 60 lb 12-0-0-26, 1/2 gallon zinc/a, and 20 lb N actual. Herbicides used were 3 pt Prowl PPI with fertilizer, and 4 pt of Pursuit 17 days after planting. The field was sprayed for bean beetle in late August. Conservation tillage was used.

Cass: Previous crops: 1989: soybeans 1990: corn. Herbicides used were Pursuit Plus 2/3 actual rate of 2.5 pt (1.65 pt), and Squadron 1/3 actual rate of 3 pt (1 pt) both applied PPI. Cultivated once and hand weeded.

Clay: Previous crop was corn. Herbicides used were 2 pt of Dual and 1.6 lb of Lorox. Broadcast 20 lb/a phosphate. Cultivated once and hilled once.

Furnas: Corn for the past two years. Fertilizer used was 7 gal 10-34-0. Herbicide used was 2.5 qt Lasso in 14 inch band with planter.

Nuckolls: Previous crops: 1989: soybeans 1990: corn. Fertilizer used was 5 gal 10-34-0. Herbicide used was Lasso banded at planting. This plot was ridge planted.

Richardson: Previous crops: 1989: soybeans 1990: corn. Herbicides used were Canopy 4 oz and Freedom 3 qt. Cultivated once and hand weeded.

Brown: Previous crops: 1989: soybeans 1990: corn. Herbicides used 1/3 pt Scepter and 1 1/5 pt Trellan both PPI. This plot was cultivated once.

Dawson: Previous crops: 1989: soybeans 1990: corn. Herbicides used 1 1/3 pt Command and 2/3 pt Lorox in a 20 inch band at planting. Ridge till program used.
