ACKNOWLEDGMENTS

This Circular is a progress report of variety trials conducted by personnel of the Agronomy Department and the South Central, West Central and Panhandle Research and Extension Centers and their associated agricultural laboratories. Conduct of experiments and publication of results is a joint effort of the Agricultural Research Division and the Cooperative Extension Service. Tests were supported in part by fees paid by commercial seed companies and the Nebraska Wheat Board.

Special acknowledgment is made to farmer cooperators who furnished land for experiments; also to Extension Agents and others who assisted with the tests.

The authors wish to acknowledge the assistance of the technical support staff: Greg Dorn, George

Hoffmeister, Glen Frickel, Del Dovel, John Eis, and Donald Thraulkill. Their help is vital to this research.

We wish to thank Dr. John Watkins for his assistance in monitoring diseases in several counties.

We would like to thank the Nebraska Wheat Board for contributing wheat check-off money and the Nebraska Agricultural Statistics Service for compiling data on varieties and production of wheat. We acknowledge the High Plains Climate Center at the University of Nebraska-Lincoln for assistance in preparing the climate data and providing climate information for this study.

NEBRASKA FALL-SOWN SMALL GRAIN VARIETY TESTS 1995

The 1995 estimated winter wheat yield for Nebraska was 41 bushels per acre from 2,100,000 harvested acres. The total production of winter wheat for the state was 86,100,000 bushels.

This circular reports data from winter wheat and winter barley trials conducted throughout Nebraska. Entries included varieties or hybrids and promising experimental strains from Nebraska and surrounding states and private breeders. This was the fourteenth year for privately developed varieties. The state has been divided into four districts for purposes of variety testing. Locations of the 1995 variety tests are shown on the map on page 10.

Trials were located on Research Centers and private farms. Names of cooperators and dates of planting and harvest are shown in Table A. Soil type, soil test data, and fertilizer applications are shown in Table B. Plot sizes varied with location. Drill strips were used in Lincoln (field plots). Nursery-type plots six rows wide and 15 to 35 feet long were planted at other locations. All tests were direct combined. Entries were replicated 4 to 6 times.

The 1995 season started with dry conditions in the west resulting in planting being ahead of schedule. As of September 25 eighty-two percent of the state wheat crop had been planted compared to 67% last year and the 5-year average of 70%. A cool wet spring resulted in some much needed moisture in the west but also put the wheat crop behind. Heading dates were up to two weeks later than normal. The Southeast

corner of the state was wet and cool until June 12, when it turned hot and dry. As the wheat matured whole heads or parts of them appeared bleached in color. This description fits the symptoms of Fusarium foot rot also known as dryland foot rot. When the hot, dry, windy weather occurred the infected roots were unable to support growth and the affected plants began to die starting with the head. This resulted in poor yields and some poor test weights. The yields and test weights got better going to the west with some test plots averaging over 60 bushels per acre.

Winter Wheat Varieties

'Arapahoe' was released in 1988 by the Nebraska Agricultural Research Division and the USDA-ARS. It is well adapted to most dryland sites in the northern and western HRW regions. Its parentage is: Brule/3/Parker*4/Agent//Beloterkovskaia 198/Lancer.

'Akron' was released in 1994 by the Colorado Agricultural Experimental Station. It is a semidwarf, awned, white chaff wheat variety with good yield potential. Grain quality and leaf rust resistance are superior to TAM 107.

'Halt' was released in 1994 by the Colorado Agricultural Experimental Station. It is a white chaff, semidwarf wheat that has excellent resistance to the Russian wheat aphid. It is early maturing with good straw strength and has also yielded well under dryland conditions.

'Ike' is an early maturing, medium height variety with fair to good winterhardiness. It has good drought tolerance, very good test weight patterns and is well suited for ecofallow wheat. Ike was developed by Kansas from the cross Dular/Eagle//2*Larned/Cheney/3/Colt.

'Nekota' (New for 1995) is a moderately early maturing, medium height variety. It appears best adapted to southern and west central Nebraska. It has good winterhardiness and tillering ability. This variety was developed by Nebraska and the USDA-ARS from the cross Bennett/Tam 107.

'Niobrara' (New for 1995) is a moderately early maturing, medium height variety. It appears best adapted to west central and western

Nebraska. It has good winter hardiness and tillering ability. Niobrara was developed by Nebraska and the USDA-ARS from the cross TAM 105*4/Amigo//Brule selection.

Pedigrees of Nebraska experimental strains are as follows:

NE88584 - Centura/Dawn//Colt Sib

NE90479 - KS83H2510/Brule Comp.

NE90524 - Brule sel/4/Bez/3/Ctk//Arthur/Ctk78

NE90625 - Tx79A2729//Caldwell/
Brule Sel#6/3/SXLD

Winter Wheat Performance

Yield, bushel weight, and other agronomic data are listed on pages 14 - 29. Each district is listed on separate tables with yields of individual locations, average agronomic data, and a summary of the last five years. Page 31 summarizes the yield of each variety at each of the locations where it was entered and page 32 shows the yields as a percentage of three check varieties (Arapahoe, Redland, and Siouxland). Page 33 lists the bushel weights for the varieties at each of the locations where it was tested. Page 34 summarizes the protein data for each location.

Yielding ability of different varieties cannot be measured with absolute accuracy because of variations in soil fertility, moisture, and other factors. For this reason, small differences in yield have no significance. Unless the difference in yield of two varieties is greater than the difference required for significance shown in the tables, little confidence can be placed in the superiority of the one over the other in that particular test. These differences are shown at the 5% and 25% levels, meaning that differences as large or larger could be expected through chance alone in 1 of 20 trials (5%) or 1 of 4 trials (25%). Even though two varieties are not statistically different, there may be other factors which influence the choice of one over the other. Such factors as their ability to complement other varieties, disease resistance, or availability of seed may influence that decision.

There were three trials conducted in the Southeast district, one in Saline County and two in Saunders

County. Page 14 lists the data from the Saline and Saunders County test. Pages 15-16 show the five year summary for the southeast district. The Saline County test was planted September 27 into a firm seed bed with good moisture at a rate of 60 lbs/a. Soybean stubble was disked lightly and then harrowed prior to planting. Rawhide had poor emergence due to seed quality. A wet and cool spring followed by hot and windy weather in June led to disease problems such as Fusarium foot rot, Barley Yellow leaf and Tan spot. The later maturing varieties held on and performed better with the plot averaging 35 bu/a. There was no lodging. The Saunders County test were planted October 6 and harvested July 17 & 18. Too much wet and cool weather hurt yields and test weights here also.

The two trials in South Central Nebraska were in Clay and Nuckolls Counties. The Clay County plot was located at the South Central Research & Extension Center, Clay Center. The soil type was a Hastings silt loam that was fallow in 1994. The 26 varieties were planted on September 21 at a rate of 75 lbs/a in a 40 foot plot. Stand evaluation was recorded in the fall and flowering dates occurred mostly in June. Wheat was harvested on 12 July, 1995. The Nuckolls County trial was planted September 21 in a continuous wheat field at a rate of 75 lbs/a. About ten days before harvest a strong gusty wind caused severe lodging in most of the plots. The plot was harvested July 13 with an average of 36 bu/a.

Six trials were conducted in the west central District. These were located in Keith, Perkins, Hitchcock, Furnas, Custer, and

Lincoln County. Plant emergence and winter survival was good at all locations. At planting, surface moisture was lacking at Furnas county. The seedbed was dry and loose at Hitchcock and Perkins county but timely moisture after planting resulted in good plant stands. Starter fertilizer (8.5 gallons of 10-34-0) was applied at planting at Custer, Hitchcock, and Keith county. Soil test data was used to determine that starter was not needed at Furnas and Perkins county. At Custer and Furnas county the plot area was treated with Ally + 2,4-D on March 15 & 16 respectively. The Custer county plot also received a fungicide treatment of Bayleton 50DF + Dithane F45 + X-77 to protect it from an outbreak of leaf rust. A moderate infestation of leaf rust was observed in the Furnas county plot. At Perkins county, Amber + 2,4-D was spring applied for weed control. The Perkins county plot suffered slight hail damage from a storm on May 21. No herbicide treatments were applied at Hitchcock or Keith counties because of wet soil conditions, however weed pressure was very light. The Keith county plot was harvested by commercial harvesters and thus harvest data was lost. There was some lodging at the Lincoln county plot that reduced the yield. Above normal spring and early summer precipitation contributed to very good yields at all of the West Central District locations.

Seven trials were conducted in the west district, they were Kimball, Scottsbluff, Dawes, Banner, Box Butte, Cheyenne ecofallow and Cheyenne irrigated. The Kimball county test was planted September 9, 1994 and harvested August 2, 1995. This plot didn't get the rain that most of the Panhandle did early in the spring and late in the summer. It did get enough rain early in the

summer to average 47 bu/a and a nice 61.4 pound test weight. The Scottsbluff county test was planted September 13, 1994 into a Keith loam soil that was fallow in 1993. Starter fertilizer and 2,4-D were applied to this plot and it was harvested July 26, 1995. There was little or no lodging in this test. The Dawes county plot had excellent moisture all year. It was planted September 14, 1994 and harvested July 27, 1995. Lodging was fairly high but it still averaged 69 bu/a. The Banner county plot was planted September 8, 1994 and went through a dry spring before receiving above average moisture in the summer. This plot was harvested July 25, 1995 and averaged 44 bu/a. The Box Butte county test was planted on September 7 into a very dry seed bed. The rains were timely through spring and summer as the plot averaged 77 bu/a. The Cheyenne county ecofallow test was planted September 19, 1994 into Proso millet stubble. Good moisture and seedbed conditions led to a nice stand. Above average summer moisture helped the plot to a 54 bu/a average which was harvested August 2, 1995. The Cheyenne County irrigated test was planted September 16, 1994 and harvested July 28, 1995. The results of the 1995 irrigated test can be found on page 28 and the five year average are found on pages 29-30. The results of the 1995 dryland trial can be found on page 24 and the five averages are found on pages 25-27.

Protein and seed size was collected from two replicates of each location. The seed size data are reported as thousands of seeds per pound. Thus, a larger number represents smaller seed size. The protein data were combined within each district and reported in the district tables. They are also summarized on page 34. Protein was determined from whole grain using a

Near Infrared Spectrometer. The protein analysis was done by the Soil and Plant Analysis Lab at the University of Nebraska.

WINTER BARLEY SUMMARY 1995

The 1995 winter barley variety trials were planted at five locations: Lincoln, Deweese, McCook, North Platte and Sidney.

"Tambar 500", a release from Texas A&M university, and two Kansas varieties: "Weskan" and "Kanby", were included again in the trial this year. Twenty-eight Nebraska lines were tested this year, four of which, ("Kearney", "Hitchcock", "Dundy", and "Perkins") were earlier releases. "Centurk 78" is a winter wheat that is used as a winter hardiness check. Due to the snow cover this winter, all locations failed to show any differences in winter survival.

The winter barley finished well despite the number of diseases that came in this spring. Heavy rains brought in a number of leaf blotch and leaf blight diseases. A moderate to heavy infection of leaf rust was evident at the Lincoln location. Most of the disease appeared after the critical grain filling time, and did not affect yields in any way.

The top yielding locations this year were Sidney, McCook, and Lincoln. Bacterial diseases at the Deweese site, and a late harvest at North Platte, lowered yields and inflated coefficients of variation at these sites.

The top yielding variety this year was NE91702, closely followed by Tambar 500, NE92714, and NE94725. This appeared to be a "Dundy year", one in which barleys with good overall disease resistance did very well. See page 35.

Straw strength was another factor this year for yield. The heavy rains that hit the southeast corner of Nebraska made selecting for straw strength a relatively easy task.

Overall, this was an excellent year for winter barley. Nebraska barleys that are in consideration for release are NE86954 and NE90721. If released, both will be grown at a Foundation Seed source in Kansas.

NE86954-Hitchcock/Maury//
Hitchcock is a high yielding variety with excellent straw strength. It is an awned barley with a short head and a dense spike. NE86954 has excellent winter hardiness which comes from its Hitchcock background. This barley has done consistently well from year to year over all locations.

NE90721-Dundy/OK77559 is a line which has very good resistance to barley yellow dwarf virus and general leaf diseases. NE90721 is slightly taller than NE86954 and has moderate to strong straw. Its winter hardiness and yields tend to be lower than NE86954 except in years when barley yellow dwarf infection is heavy. See page 36 for parentage of other winter barleys.

Locations of 1995 Nebraska winter wheat and winter barley variety tests.

2163	early	fair	very strong	short	medium	fair	R	MR	MS-MR	R	LT	PIO/KSU	1989	yes

1 These comparative ratings are based on each variety's average performance within its area of adaptation under normal Nebraska growing conditions and cultural practices. This chart is updated annually. Plant appearance may be influenced by soil, weather, pests, and other production conditions.

2 R=resistant; S=susceptible, MR=moderately resistant; MS=moderately susceptible. The reaction may vary depending on how favorable conditions are for disease or insect development practices and/or plant growth or deviations are genetic resistance with the variety. Sources used to compile this information include: field and greenhouse observations and other state university materials. (a) Relative varietal reaction to wheat streak mosaic virus is based upon actual Nebraska yield data from the 1988 and 1989 crops years or other comparable tests. MT=moderate tolerance, LT=low tolerance, MS=moderately susceptible, S=susceptible.

3 If "short" stand uniformity and establishment will be reduced by sowing seed more than 2 inches deep. Deep seeding may also reduce stand of medium and long coleoptile varieties.

4 Actual height and bushel weight will vary widely with season, location, and production conditions. General bushel weight ratings: Very Good=62 lb/bu, Good=60 lb/bu, fair=56 lb/bu. General height ratings under optimum moisture): short=30-35", medium=35-40", tall=40-45".

5 If "yes" the Plant Variety Protection Act prohibits unauthorized seed production. The seed may be sold for planting purposes only when properly grown and labeled as Certified Quality seed.

6 Maturity may become later compared to other varieties as Siouxland is moved north or west due to response to available heat units.
