# Cattle Value Computation Tables:

On a Per Head and Selected Lot Basis

COLLEGE OF AGRICULTURE  
LIBRARY

Allen C. Wellman  
Extension Economist (Marketing)

Animal value (sale price times weight) computation table can be used to determine on the spot cost or value of an individual animal. The total cost or value of selected lots of animals can be determined from a second table.

Market cost or value of an individual animal and of selected lots of animals computed for each table has been rounded to the nearest whole dollar.

To use the first table, "Value of a Beef Animal at Various Weights and Prices," you must know or be able to estimate the weight of the animal and the market price. Then find the animal weight in the lb. line and the column with the market price in dollars per 100 lb. The animal cost or value is the price where the line and the column intersect.

For example: a 650-lb. feeder steer with a market price of \$28.50 has a value or cost of \$185 (rounded to the nearest dollar).

To use the second table, "Total Value of Selected Lot Sizes of Beef Animals," you find the value or cost of the individual animal column across the top of the table. Then find the numbers of animals in the lot line. The total cost or value of that lot of animals is where the line and column intersect.

For example: the value of each animal in a 50-head lot of slaughter steers is \$350. From the table you find the 50-animal lot size line and the \$350 total selling price column and determine the total lot value to be \$17,500.
