Standards

A species will be included on the valid list of North Dakota birds when both of the following criteria are satisfied:

1. Its occurrence in the State is free of doubt as determined by fulfillment of at least one of the following:
 1. One or more clearly identifiable photographs is presented
 2. A correctly identified specimen is preserved and maintained in a museum or collection
 3. A fully audible voice reproduction is presented
 4. Three or more observations are obtained; each such observation or sight record must be supported by a completed documentation form submitted to the North Dakota Ornithological Records Committee (NDORC). No more than two of the sight records may be made by the same individual, and these must be separated in time and space. When three documented sight records acceptable and approved by NDORC have been reviewed, the species can then be added to the valid list based on sight records alone.
2. The bird(s) occurred in the State as wild and free-flying, and there is no evidence to indicate it occurred as an escape or as a release from captivity.

A species will be placed on the hypothetical list when less than three acceptable sight records have accumulated, and none of the other criteria for the valid list has been met.

All observations of species not on the valid list in North Dakota will be reviewed by the NDORC. Supporting documentation is to be submitted by the observer on a standardized form. These completed forms are submitted at the end of each reporting period to the appropriate compiler of North Dakota records for American Birds. Observations of casual, extra-limital, out-of-season, or other unusual occurrences will be reviewed by NDORC to determine their appropriateness as acceptable records.

Acceptance of a record that is classified under criteria 1.1, 1.2, and 1.3 above (primarily for first State records) will be made by a unanimous decision of the NDORC. Records classified under criteria 1.4 above (including subsequent State records, unusual dates, or out-of-range birds) will be accepted or rejected by a simple majority vote of the Committee.

Summary

This current list includes 365 species of which 353 are considered valid and 12 are hypothetical. A breakdown of this list includes 207 species that nest or have nested, 95 that occur as migrants, 28 accidental, 21 occasional, 2 extirpated, and 1 extinct species. Species that have nested at least once in the State are indicated with an asterisk (*) in the list. An additional 16 species that are either summer residents, casual, or primarily migrants are considered to be inferred nesting

species, based on observations of territorial behavior in the proper habitat during normal breeding periods. These species are indicated by (i) before their name in the list. Including those with inferred breeding status, at least 223 species can now be considered components of the breeding avifauna of North Dakota.
