New distribution records for *Arthrolips fasciata* (Erichson) (Coleoptera: Corylophidae)

While curating the Corylophidae in the Florida State Collection of Arthropods (FSCA) I came across a pair of strikingly marked *Arthrolips* from the Florida Panhandle. Shortly thereafter, I found another pair of apparently identical beetles from Taiwan. Examination of the spermathecae sup-

Figure 1. Habitus of *Arthrolips fasciata* (Erichson) from Taiwan.

ported the conclusion that the two series represented the same species. Based on the illustrations of the spermatheca and habitus supplied by Bowstead (2003), both series are *A. fasciata* (Erichson). This species was described from Tasmania and has been recorded also from New South Wales and New Zealand, and recently (Bowstead 2003), as an immigrant, from France. Bowstead (2003) says that this species "...is at once recognisable by its distinct and handsome colouring, of red pronotum and dark elytra with bright red transverse median band..." (Fig. 1). This species seems to be associated with pines (Bowstead 2003).

Label data for the FSCA specimens are: "FLORIDA: Santa Rosa Co., 1 mi. N Holley on St. 87; 15-IV-1989 R. Woodruff, B. Beck & P. Skelley", 2; "TAIWAN: Taoyuan County Upper Palin, Lalanhan 11-18-VII-1996 J.B. Heppner, 1500m", 2. They constitute **new country records** for the United States and Taiwan for *A. fasciata*.

This is Entomology Contribution No. 1013, Bureau of Entomology, Nematology, and Plant Pathology, Florida Department of Agriculture and Consumer Services.
