Harvesting Everlasting Flowers for Drying

Everlasting flowers are flowers that retain their color and form when dried. Many everlasting flowers are composed of colorful, papery petals called bracts, that are stiff and dry while still attached to the living plant.

Drying or preserving these flowers is a popular gardening activity. Dried materials are long lasting and can bring warmth and color to the home during the cold, gray winter months. The most important thing to know about everlasting flowers is when to harvest the flowers so they best retain their color and form. Picking them too early or too late causes them to become misshapen or darken as they dry. Each type has its own best time for picking which a gardener learns through experience.

The simplest way to preserve flowers is air drying. Gather these drying materials throughout the growing season when they are ready. The best time to cut is at midmorning, after the dew has dried but well before any flowers wilt. Dampness can lead to mold and slows drying.

Take as much stem as possible, because you’ll need long stems for bunching and for height in the arrangements.

Once harvested, strip the foliage from the stems. Tie the stems into small bunches with rubber bands. Hang the loose bunches upside down in a warm, dry, well-ventilated place, such as a spare bedroom or large closet. Use a dehumidifier along with a low-speed fan to circulate air. The quicker the drying process, the better. (Harvested flowers wilt. Dampness can lead to mold and slows drying.)

Flowers should be harvested when the flowers are fully open and before the center opens. Insert a #22 gauge wire into the bottom of the flower (where the stem was) and store dried flowers upright in styrofoam.

To dry so that the stems dry thoroughly, usually 2 to 3 weeks. When dried, the stems should snap. Dissect one or two flowers, and make sure they are thoroughly dry inside.

Collecting flowers at the proper growing stage is vital to insure high quality plant material. The proper times to harvest specific flowers are listed below.

**Annuals**

Cockscomb (Celosia species) - Both plumed and crested types can be dried. Harvest plumed celosia when the blooms are bright and nearly fully opened. Harvest crested celosia when the seeds begin to form just below the comb.

Cock’s Comb

Strawflower (Helichrysum bracteatum) - Harvest only the flower, not the stems or no stem attached. Pick when only a row or two of outside bracts are opened and before the center opens. Insert a #22 gauge wire up the bottom of the flower (where the stem was) and store wired flowers upright in styrofoam.

Strawflower

Starflower (Scabiosa stellata) - The flower heads should be harvested when the last few lavender-pink flowers have fallen off, revealing the gray-green, cup-like calyces. Globe Amaranth (Gomphrena globosa) - Cut the stems when the flower heads are in the peak of color. Tie the stems together and hang upside down to dry.

Starflower

Love-in-a-mist (Nigella damascena) - Harvest pods when mature. Air-dry in bunches upside down in a dry place. (Flowers are difficult to dry.)

Love-in-a-mist

Meadow Sage (Salvia species) - Pick the spikes when the florets are fully open and the calyx is bright blue. Tie stems together and hang upside down to dry.

Meadow Sage

**Perennials**

Yarrow (Achillea species) - Cut the stems as soon as every umbel on the head is fully developed and firm to the touch. Dry upright or upside down.

Yarrow

Scorch—curse of plants on the plains

Scorch is nothing new. It is reported each year on plants like maples, birch and mountain ash.

Conditions leading to moisture stress such as high temperatures on a windy day, low soil moisture and shade tolerant plants exposed to full sun will leaf in leaf tissue death. Symptoms first appear on the leaf edges and work their way inward. Scorch also occurs in shrubs such as currants, gooseberries and azaleas. When these plants are exposed to direct sun or reflected off a building, scorch occurs.

Locate these plants where they receive mid-day shade. Also, select or modify sites so that plants are protected from wind and the soils have high organic matter. During the summer, sod will keep the soil cooler and reduce water loss. (DJ)

Storing extra seeds

Unused seeds that keep for at least five years are broccoli, thought, it is a simple task to save seeds for use in next year's garden. Unused seeds may hold up to 3 inches.

Transplanted to watered seeds, means lawns on sandy soil may need to be watered every other day during hot, dry weather. Lawns on heavy soils, however, may need watering only once a week.

Watering should supply sufficient moisture to wet the soil to a depth of 6 to 8 inches to encourage normal root development. Light sprinkling—even if it's done more often—means most of the water is lost to evaporation and little moisture gets down to the grass roots. As a result, the roots don't grow as deep nor develop as well and leaves the grass even more subject to drought stress.

It is difficult to get water to soak in to the rich depth in one application on lawns that need extra moisture until runoff occurs, then switch to another area until water is soaked in, go back and water again until runoff.

Keep up the procedure until the required amount is put on, then back off until you observe the beginning of visual drought symptoms in the grass: gray-green color or foot-printing. Then repeat the cycle.

Use side-sloped cans to determine how much water is being applied in terms of the number of inches per hour.

Avoid watering in the late evening because of increasing the possibilities of disease problems. The best time is in the morning (3 a.m. for automatic lawn sprinklers) until noon. Advantages are less demanding on the water system, reduction of disease probability, less evaporation and less wind, promoting more uniform coverage. (DJ)

New grass faces the big test

If any of the lawn grass around your home is new this year, keep a close eye on it through this summer. It may need special care.

Newly planted cool-season grasses will not have the hardiness of mature grass that has weathered a couple of growing seasons— that's why it calls for special attention.

Don't allow it to wilt excessively before watering. And when a choice has been made to water, favor the new grass over any established sod. Shallow, frequent watering is not good; give it a good soaking when you do water. Mowing practices are also important to new grass. Mow frequently to prevent shock and sunscald caused by cutting off too much grass at one time. And keep the mower blade sharp to avoid bruising and tearing grass blades.

A further favor to the new grass is protecting it from heavy use this first year. Recreational activities and wear by fenced animals are especially hard on it.

Figure the new grass is facing its most severe test right now. New grasses often thin out or are invaded by weeds, or they may be lost completely because of summer heat stress. Good management is critical at this time. (DJ)

Watering tips

We're deep in summer now, and whatever the weather has been up to now, the worst is likely yet to come for lawn grasses. Hot, dry weather calls for careful watering of lawns. How much they need depends on rainfall, of course, but also on the soil under your lawn.

Your lawn grass will use about 1 inch of water per day from the upper 12 inches of soil in your yard. In general, coarse and sandy soils may not hold much more than 1/2 to 1-1/2 inches of water in that upper 4 inches, and you may lose 1/3 of this to evaporation. When grass is allowed to go dry, the roots don't grow as deep nor develop as well and leaves the grass more subject to drought stress.

It is difficult to get water to soak in to the rich depth in one application on lawns that need extra moisture until runoff occurs, then switch to another area until water is soaked in, go back and water again until runoff.

Keep up the procedure until the required amount is put on, then back off until you observe the beginning of visual drought symptoms in the grass: gray-green color or foot-printing. Then repeat the cycle.

Use side-sloped cans to determine how much water is being applied in terms of the number of inches per hour.

Avoid watering in the late evening because of increasing the possibilities of disease problems. The best time is in the morning (3 a.m. for automatic lawn sprinklers) until noon. Advantages are less demanding on the water system, reduction of disease probability, less evaporation and less wind, promoting more uniform coverage. (DJ)

Storing extra seeds

Seeds can survive several years when given the proper environment. Although optimum storage life varies among species, most seeds will survive at least two years, with some lasting for centuries.

Although optimum storage life varies among species, most seeds will survive at least two years, with some lasting for centuries. Whether they are leftovers from the seed you purchased, or seeds you have gathered from your own plants, with a little care and attention, your seeds will survive at least two years, with some lasting for centuries.

Audubon purchases 610-acre O'Brien Ranch Audubon Nebraska Headquarters and Education Center to be located south of Denton

On June 24, Audubon Nebraska announced the purchase of the 610-acre O’Brien Ranch, 15 miles southwest of Lincoln, which will be known as the Audubon Spring Creek Prairie. The ranch has been purchased to protect the unique parcel, which includes one of the largest remnants of tallgrass prairie in the state and distinct nut trees created by wagon traffic on the Oregon Trail. The site will be the headquarters of Audubon Nebraska and a state-of-the-art education center for the public.

Located just south of Denton, the Audubon Spring Creek Prairie includes some of the tallest hills in Lancaster County, making it a place of great scenic beauty, as well as diverse habitat. In addition to hundreds of acres of rare tallgrass prairie, the site also includes wetlands, springs, ponds, creeks, and woods, which provide homes for Nebraska’s native fish and birds from North America’s migratory birds.

The land has important historical significance as well, since wagon ruts from the Nebraska City/Fort Kearney cut off to the Oregon Trail are still clearly visible. According to David Murphy, a senior research

Dealing with unwanted guests

Have a lost bat flying around your living quarters? Bats that fly into human living quarters are lost for a reason. Their primary goal is a safe escape. They often will leave on their own if a window or door to the outside is opened while others are closed. Bats are not aggressive, even if chased, but may fight to the death. As with any wild animal, bats should not be handled with bare hands. An exit should be evaporative

Environmental Focus

Household hazardous waste collection September 12 • 9 a.m. to 3 p.m. Pfizer Animal Health, 601 West Cornhusker Highway

Bring household products containing mercury (thermometers), solvents (paints and varnishes), pesticides (weed killers and insecticides) and PCBs (ballasts from fluorescent fixtures). Leave products in their original containers and keep labels intact. For more specific information, contact the Lincoln-Lancaster County Health Department at 441-8040. (BPO)

Allergic to bee stings? Bees and wasps are most active in late summer when their colonies have grown to maximum size and members are busily supplying their colony with food before cold temperatures arrive. We encounter these insects regularly—especially if we spend time outdoors.

• No Reaction. About 10% are immune to stings from birth and do not react to stings; more than 70% of us can develop immunity after repeated stings.
• Mild Reaction. There is pain for a few minutes at the sting site and swelling which subsides in a few hours, followed by itching and redness.
• Local Reaction. There may be an unusual amount of swelling around the sting which may persist for several days.
• Toxic Reaction. This occurs with multiple stings and reactions may include headache, fever, fatigue, diarrhea, vomiting, unconsciousness and convulsions.
• Generalized Allergic Reaction. Generalized reaction occurs to parts of the body other than where the person was stung. Reactions may range from slight to serious shock and may include wheezing.
Fruit, vegetables and freedom to farm

The 1996 USDA Farm Bill, commonly referred to as the "Freedom to Farm" bill, led producers of farm commodities to believe planting limitations would never again be a problem for those receiving USDA benefits. To a large extent, this is because of exceptions to the rule do exist. Planting of fruits and vegetables (FAV), do fall into this category. Specific rules were written into the bill placing limitations on planting FAV on contract acres. Contract acres can be basically defined as the number of cropland acres of a farm on which farm program payments are calculated. Not all cropland acres on a farm are necessarily contract acres, but this is the rule that governs where a farm's total cropland is totally under contract acreage. The land is of particular concern when FAV are planted, but producers must be aware of contract acreage on any farm program payments are made. Producers are not precluded from planting FAV on non-contract acres. For regulations exist requiring all producers planting FAV to report the FAV acreage to the Farm Service Agency (FSA) in a timely fashion.

Two conditions exist that may allow planting of FAV on contract acres. The most unrestricted condition occurs when the producer has a history of planting FAV on that farm. Under this condition, producers may select and plant on contract acres, but with a resulting acre for acre reduction in program payments.

To prevent violations, simply visit or call the local Farm Service Agency administering your farm program benefits...

The second condition allows for planting of FAV on contract acreage when the producer has a history of planting non-contract FAV. Under this second condition, the producer may plant up to his/her producer acreage history of the specific FAV on contract acreage, again with an acre to acre reduction in program payments. At this time, 1989 and vegetables are listed as crops that must be reported to and which restrictions apply on contract acres. This list is available at the local Farm Service Agency and the County Extension Office.

What is LB1209 and does it affect you?

Nebraska has had legislation in place for a number of years which authorizes the Nebraska Department of Environmental Quality, under Title 130, to administer the state’s livestock waste control regulations. The Livestock Waste Control Act (LB1209) passed by the 1998 legislative session and signed into law on April 15 by Governor Nelson affects various aspects of the way DEQ administers and enforces provisions of Title 130. Under LB1209, “livestock operations” are defined. All operations meeting the criteria to be classed as a livestock operation (see definition below) must request an inspection by the DEQ. The purpose of the inspection is to determine for what livestock waste from that operation is entering surface water or groundwater. Those found to have potential to pollute surface water or groundwater are required to obtain a livestock waste control facility permit. Permit inspections are only of theMany of the many livestock feeding operations are already operating under a livestock waste control facility permit. The legislation clarifies which operations need a permit and sets deadlines and specifies fines for those found in violation. (Violation of any requirement of LB1209, including failure to request an inspection by January 1, 2000, is subject to a fine of up to in some cases $10,000 per day of violation.)

Who needs to request a DEQ inspection? Under LB1209, any “livestock operation”, regardless of size, needs to request an inspection if a livestock waste facility is required. Forms to request an inspection are obtainable at the extension office or from DEQ.

What defines a “livestock operation” under LB1209? A “livestock operation” is defined as the feeding or holding of beef cattle, dairy cattle, horses, swine, sheep, poultry and other livestock in buildings, lots, or pens which normally are not used for the growing of crops or vegetation. If you raise livestock, you need to answer the following two questions to determine whether you need an inspection. First, are the live- stock located in buildings, lots, or pens? (Calving facilities are excluded.) If the answer is "no", you don’t need to request a DEQ inspection. If the answer is "yes" you need to answer the next question.

A second question is, “Is the land where the animals are roaming normally used for growing crops or vegetation (e.g. grass or annual plants) or is it?” If the answer is “yes” (e.g. grazing cattle in corn stalks or cattle on pasture), then no inspection is needed if the answer is “no” you need an inspection. Cattle feedlots and swine operations likely will need inspections (unless you are growing “free range” swine on pasture or deep feeding calves on pasture).

What does it cost to have an inspection?

If the request for an inspection is made before January 1, 1999, an inspection fee will be charged. The fee varies according to the size of the operation, $50 for small operations and $500 for large operations. Call the DEQ (402-471-2186) to ask about the fee schedule.

If the inspection determines that a waste control facility permit is required, what additional steps need to be taken?

A permit application must be sent to the DEQ, along with a form fee which varies with the size of the operation. The permit application must be complete, correctly filled out, and submitted to DEQ. The application includes a list of many items such as: NRDs for enterprises. If there are any questions, please contact the Farm Service Agency or the USDA Service Center at 402-

How often to pump your septic tank

Your septic tank must be cleaned or "pumped" periodically to remove the solids that accumulate in the tank. How often you need to clean your septic tank depends on its size and how carefully you are using it about out. In new homes, clean it prior to occupation. Clean it again within six to twelve months, to make sure it is functioning properly. Wastewater from washing, painting, varnishing and other construction activities can reduce bacterial activity in new systems.

Once a system is operating properly, the tank should be cleaned every one to two years. It is best not to go more than three years between cleanings. Proper cleaning removes the scum and sludge. Liquid contents are pumped back and forth from the tank to the tank until all solids are liquefied and removed. If floating scum is left in the tank, solids may enter the drainfield. Cleaning leaves a black film on the sides of the tank and a small amount of liquid on the bottom. These contain bacteria which allow the tank to begin working again. There is no need to add a starter after cleaning.

The contractor should inspect the tank to make sure baffles are in place and functioning properly. Contractors cleaning the tank through four or six "inspection pipes" often do not remove all solids and may damage baffles. Insist that your contractor clean the tank through the manhole. Most tanks have one or two manholes that are often buried below the ground surface. A little digging may be necessary to find them. Remember, a few dollars spent every one or two years on proper cleaning can save you big dollars on repairs, which can run an unexpected $2,000 to $10,000.

Estimated septic tank pumping frequencies in years (for year-round occupancy): (DJ)

Note: More frequent pumping needed if garbage disposal is used.

Flies

Most species of flies have a general type of life cycle that includes egg, larva, pupa, and adult, with the latter being the animal parasitic stage. A few, such as bots, are specialized parasites, with the larva being the parasitic stage.

Stable and house flies are the most common insect pests of all livestock, including horses. Animal waste management is vital to any successful fly control program. Both species of flies lay their eggs and develop as larvae in decaying organic matter such as spilled hay or bedding straw mixed with urine and manure. Wet, decomposing organic matter creates ideal breeding conditions for both fly species.

Stable fly

The house and stable fly are similar in size, appearance, and life cycle, except that the house fly completes its life cycle in about two weeks in the summer, as opposed to three weeks for the stable fly. The stable fly has piercing, sucking mouthparts with which it penetrates the skin, primarily on the front legs, and feeds on blood. The fly bites inflict pain to the animal which responds by kicking out and swelling the affected area, an effort to dislodge the fly. House flies have a spongiform body which allows them to eat soft foods and to fly into buildings. Bedding and manure should be removed at least weekly.

This waste material can be spread on fields or in pens, but must be spread thin enough to dry quickly. If it is stored for future spreading, it must be packed in steep-sloped piles that do not allow penetration of moisture, or covered with black plastic that creates enough heat to kill developing fly larvae. Insecticides may be applied as residual or area sprays, or as animal treatments. The residual sprays are applied to fly resting areas.

Stable flies rest in shady areas such as fences, bunkers, and the sides of buildings. House flies rest "(zoo's)" at night inside of buildings on the ceiling, walls, or under eaves. Residual sprays should remain effective for seven to ten days if not washed off by rain or exposed to direct sunlight.

Caution

Use only insecticides that are USDA approved and EPA registered for use on horses. Wettable powder (WP) formulations are generally preferred over emulsifiable-concentrates (EC) because horses are sensitive to skin burns from solvent carriers in some EC formulations.

Always read and follow the label directions and observe treatment restrictions, such as minimum age of animal to be treated, or warnings concerning treatment of sick animals, or treatment in conjunction with other medications. Lists of approved insecticides for use on horses are provided in EC 1550, Nebraska Management Guide for Control of Arthropod Pests of Livestock and Horses. (DJ)

Caring for animals when gone

Livestock are a very serious responsibility. They are dependent upon you for food, water, shelter and health care. When you are gone for an extended period of time they must still be cared for on a regular basis. Even in the age of automatic feeders and waterers your animals should be looked in on daily to insure that they are in good health. Feeders and waterers can break and daily proper nutrition is very important to the overall health of the animal. When you are away, you should get a reliable person that you can trust and who is familiar with the care of livestock to look after your animals.

You should also provide your "animal sitter" with the proper numbers (i.e. police, fire, local veterinarian) in case of an emergency along with a detailed description of what needs to be fed and other chores to be done, if necessary. It would be a good idea to give your sitter the number where you can be reached, if needed to be notified. Remember that your animals are still dependent on you for food, shelter and health care even though you are away. Providing them with a reliable sitter will ensure they will be just as healthy when you return as when you left them. (DJ)

Field Day features high-value crops

If you own a small farm or acreage, or if you dream of owning one someday, you don’t miss the third annual Specialty Crops Field Day. Featuring tours of nearby farms and acreages, this year’s event will highlight the production and marketing of high-value specialty crops and livestock which can be successfully raised on a few acres, and even in your own backyard.

Scheduled for Saturday, August 15, this field day will begin at the Haymarket Farmer’s Market at noon with a brief overview of the market. Maps and information will be available at the market manager’s booth all morning. Come to the Farmer’s Market early to shop and enjoy the music of the Plain Label String Band.

The tour group will meet at the Lancaster County Extension Office, 444 Cherry Creek Road, at 12:30 for lunch and a presentation on community gardening. A delicious array of locally-grown salads, fruit, sweet corn and home-baked bread will be served. Please bring your own sandwiches and drinks.

The Specialty Crops Field Day is co-sponsored by the Nebraska Sustainable Agriculture Society, the Haymarket Farmer’s Market, Lancaster County Cooperative Extension, the UNL Center for Sustainable Agriculture Systems, the Organic Crop Improvement Association Nebraska Chapter #5 and County Edge. (DJ)

Buildings

Selecting a building that is right for your farm livestock should include meeting all your personal needs in addition to your livestock’s needs. This should all be done at a minimal cost to the farm enterprise. Providing adequate housing for your animals, including proper ventilation and space, is essential and will ensure that they are getting the housing they need to remain healthy and productive.

There are several factors you must consider when choosing the building that is right for you. First, you must consider how you intend to use the building, whether it be a barn or stable to keep a few horses. The animal species will greatly affect the number of animals you can house in the facility. Each animal should have an adequate amount of resting space to ensure it is comfortable, an adequate amount of feed access, and free access to clean, fresh water. Ventilation and air quality are critical when planning livestock housing. Many facilities may require ventilation fans to move an adequate amount of air within the facility. It is very critical that you do not overlook the ventilation factor as animals residing in a poorly ventilated area will be at greater risk of sickness and disease.

Special architectural requirements for the building, such as wider doors to get large equipment through, should also be considered for your livestock building. Determine how you will clean your livestock. This will not only ensure that your animals are getting the proper nutrition they require and are in good health, but it will also enable you to relax and not worry while you are gone.

Acreage Insights

On September 12, join many other acreage owners at the Festival of Color at the ARDC Horticulture area near Mead, NE. This has become an educational festival for home gardeners for several years. Emphasis this year is on water conservation and quality through lawn and garden practices. Educational talks, demonstrations plus commercial exhibitors will highlight the ‘98 festival. (DJ)
Fresh, fabulous and safe fruits and vegetables!

Potato pointers

Potatoes are the fourth most important food crop in the world. There are 5000 varieties and are the most popular vegetable in the United States. The average American eats about 130 pounds of potatoes each year.

Potatoes are a nutritious vegetable, especially when eaten with the peel. They are loaded with more potassium than a large banana and have more vitamin C than a tomato. They contain more thiamin, riboflavin, niacin and iron than spinach. If you are looking for something that will sweeten your diet, again, the potato is a winner. It has more fiber than a slice of 100% whole wheat bread. (Reference: Bowes and Church’s Food Values of Portions Commonly Used, 17th edition.)

Potatoes have different textures because of the amount of starch and water they contain. Those with less starch and more water (Round Reds) keep their shape during cooking and are good for boiling or roasting. Potatoes with more starch and less water (Russels) loosen up during cooking which make them great for baking.

New potatoes are prematurely harvested and recently sprouted. They have a high water and sugar content and have a very thin skin. They have a waxy texture because they have not been given enough time to convert sugar to starch. This makes them good for boiling and using in salads.

Choose potatoes that are firm and have not sprouted. They should be stored in a dark, dry and cool (45-50 degrees) place. Do not store potatoes in the refrigerator because their starch turns to sugar and produces an undesirable taste. Do not store potatoes with onions. Onions absorb the moisture that causes potatoes to decay.

Q: What is the correct way to “blanch” a vegetable before freezing it?

A: Blanching is a must for almost all vegetables to be frozen. Blanching slows or stops enzyme action which can cause loss of flavor, color and texture. Use at least one gallon of boiling water for each pound of prepared vegetables. Put the vegetables in a wire basket and lower into the boiling water. Put a lid on the kettle and start counting the time immediately. Keep the heat high for the time specified for the vegetable you are freezing. The length of time will vary depending on the variety of food-stone illness. These problems are not common, it’s important that we, as consumers, handle fresh produce safely.

Blanching is done by boiling the vegetables in salted water for a few minutes. Put the vegetables into a wire basket and lower into the boiling water. Put a lid on the kettle and start counting the time immediately. Keep the heat high for the time specified for the vegetable you are freezing. The length of time will vary depending on the variety of food-borne illness. Though these problems are not common, it’s important that we, as consumers, handle fresh produce safely.

Following are some general handling tips for fruits and vegetables, including food safety recommendations from the Produce Marketing Association (PMA), U.S. Department of Agriculture (USDA) and Food & Drug Administration (FDA).

For further information and updates on safe handling of fruits and vegetables, check the Fight BAC! Web site fightbac.org/.

Nutrition Education Program

Mary Abbott

Extension Assistant

Now that you’ve read our main article on handling fruits and vegetables safely, here is a pasta salad recipe to enjoy on a hot summer day. Complete with veggies, use this as the main dish for a summer day. Complete with veggies, use this as the main dish for a summer day.

Pasta Chicken Salad

(makes 4 servings)

8 ounces medium shell pasta
1 medium red bell pepper, chopped
1/2 cup chopped celery
2 tablespoons chopped green onions
2 teaspoons prepared mustard
1/2 teaspoon dried dillweed
(8-ounce) bottle Italian salad dressing

Prepare the pasta using package directions; drain. Combine the chicken, broccoli, red pepper, celery, green onions and cooled pasta in a bowl; mix gently. Stir in the mustard, dillweed and Italian dressing; toss to coat. Cover and chill, in the refrigerator. Stir just before serving. May double the recipe. (AII)

Here are some general tips on everything from purchasing fruits and vegetables through serving and handling them safely.

Purchasing
• Purchase fruits and vegetables that look and smell fresh.
• The Produce Marketing Association recommends you buy only the amount you’ll use in a few days for most fruits and vegetables, because “starching up.” With the exception of some such as apples, citrus fruits and pottos, most other produce a nature well for long period of time.
• Handle produce gently to avoid bruising.
Storing
• Put produce away promptly. Most WHO produce keeps best in perforated plastic bags in your refrigerator’s crisper drawer where the humidity is highest. Make sure your refrigerator is clean and cold (40 degrees F or lower).
• Tomatoes will ripen faster at room temperature before refrigeration. These include: apricots, bananas, cantaloupe, kivi, nectarines, peaches, pears and plums. (Note: While refrigeration turns the skin on a banana black, the flesh will maintain good color and quality for at least a few more days.)
• Follow label instructions on fresh produce, such as “refrigerate and “use by” dates.

Q: What is the correct way to “blanch” a vegetable before freezing it?

A: Blanching is a must for almost all vegetables to be frozen. Blanching slows or stops enzyme action which can cause loss of flavor, color and texture. Use at least one gallon of boiling water for each pound of prepared vegetables. Put the vegetables in a wire basket and lower into the boiling water. Put a lid on the kettle and start counting the time immediately. Keep the heat high for the time specified for the vegetable you are freezing. Alice Henneman, RO, LMT, Extension Educator

Q: I’ve heard there’s a quick way to remove the skin from tomatoes with hot water. Can you tell me more?

A: Wash tomatoes. Dip in boiling water for 30 to 60 seconds or until skins split. Then dip in cold water, slip off skins.

Handwashing program for youth & adults

Have fun using “glo-grens” to teach handwashing as part of the “Clean Hands Campaign!” Call Extension Educator Alice Henneman (441-7180) for more information. (AH)

Call Extension Educator Alice Henneman (441-7180) for more information. (AH)

Handwashing program for your group

Teach basic home food safety by playing the award-winning “Don’t Get Bugged by a Foodborne Illness” bingo-type game with your group. Call Extension Educator Alice Henneman (441-7180) for information and to schedule a program. (AII)

Call Alice Henneman (441-7180) for more information. (AII)
We would like to thank the Keeping Families First Advisory Committee, sponsors and entertainers who attended. Congratulations to all the volunteers that helped out during the day. Check the September Nebraska News for highlights from this Sizzling Summer Sampler.

Augusta 70% and lite margarine, 80% fat, shortening 100%, margarine 70% and lite margarine or spread is around 53%. Another helpful hint: you can use one package or 2-1/2 teaspoons of yeast to 8 to 8 cups of flour in a bread recipe and the results are still good. The trip down memory lane with Alice Doane’s teapots and cups was very interesting. She has traveled to many places in our world and has quite a beautiful collection. I’m a fancier of cups and saucers and she had many pretty ones. Cindy Boss presents a very good program on preserving family photos and the many interesting ways to include facts and/or highlights of the particular event. Plus, all the items one can purchase to really have a fun and memorable family picture album. I was enthused and hope I can finish my albums one day soon. Having had one wedding and I’m off for the other daughter’s wedding, there will be lots more memories to add. Congratulations to our creative writing winners from Waverly schools, Justin Davison and Amber Haas. Thanks, you did a great job. Congratulations to our scholarship winners Corrine Jarecek and Yolanda Castellanos. Good luck to both of you in your careers. County fair time is over. Thank you to all the volunteers who helped with Health Aware- ness Day sponsored by the FCE Clubs.

Adolescents still need supervision

Not surprisingly, being alone for many hours is not a good situation for most 12 and 13 year old kids. In a large survey of eighth graders across ethnic and socioeconomic lines, researchers from UCLA and the University of Illinois found that 12 and 13 year olds who were home alone apparently makes a big difference. Researchers have found that children alone for one to four hours per week were only at a slightly greater risk than kids who were never alone. The risk factor increased according to the number of hours children were unsupervised.

This is a challenge for working parents. Good after- school activities for older children are clearly needed. Children of this age may resist organized activities, but the organized activities, but the

September FCE Council meeting
The September council meeting is scheduled for Monday, September 28, 7 p.m. Rollie Schneider will present the program “History of Medical Emergency Services & Commu- nications, 1960-1985”. The business meeting will follow the program. (LB)

We would also like to thank the organizations who hosted a booth and family activity, as well as, the volunteers that helped out during the day. Check the September Nebraska News for highlights from this year’s Keeping Families First event. (KW)

Make it Yourself with Wool Contest
Entries for the Make It Yourself with Wool Competition are due October 3. The district contest for Lancaster County participants will be held at Nebraska City, Calvary Community Church on October 17. Call the extension office for a registration form. (LB)

FCE reorganizational packets
Family and Community Educa-
tion (FCE) Club reorganizational packets will be ready for club presidents to pick up about August 17 at the extension office. It will include the dues information for club treasurers. Information in the packet has October due dates. It is time to look forward and plan an exciting and educational year for FCE. If you have questions, call Lorene or Pam at 441-7180. (LB)

Adolescents still need supervision

Not surprisingly, being alone for many hours is not a good situation for most 12 and 13 year old kids. In a large survey of eighth graders across ethnic and socioeconomic lines, researchers from UCLA and the University of Illinois found that 12 and 13 year olds who were home alone after school, no matter how many hours a week were more likely to use alcohol, smoke cigarettes or try marijuana. Of course, each home situation is unique, and other factors—such as the quality of parent-child interactions—also have an influence. However, during the early teen years, when kids are likely to assert their independence, having too much time alone gives them more opportunities to engage in risky behavior. How much time kids spend alone apparently makes a big difference. Researchers have found that children alone for one to four hours per week were only at a slightly greater risk than kids who were never alone. The risk factor increased according to the number of hours children were unsupervised.

This is a challenge for working parents. Good after- school activities for older children are clearly needed. Children of this age may resist organized activities, but the research shows the importance of making a special effort to find programs for pre-teens and early teens that support the development of their skills in the arts and sports, enrich their academic studies and provide opportunities for community service.

Character Counts! on the move
Sharing M & M’s, making flags, taking trust walks and playingact are just a few of the things young people in Lancaster County have been doing this summer. Youth in Firth, Hickman, Denton, and Bennet have learned what the “Six Pillars” are and know the do’s and don’ts associated with them. They’ve listened to community citizens tell about the importance of character in the jobs they do and they’ve shared materials with parents after the camps.

Teens have been spotted at Lincoln Parks and Recreation sites making character mobiles and teaching about responsibility and fairness to younger kids. They have made visits to work sites to shadow workers, observe the work of character exemplified in the workplace and volunteered.

Teens in this project have been trained to teach the Character Counts! curriculum and will volunteer hours at the fair and at other training and events. A culminating activity for them will be development of a portfolio and other skills needed to enter the workforce.

Both of the above activities were sponsored in part by School-to-Career of Lancaster and Saunders Counties since character traits are vital for our future workforce and civic leaders.

Six Lincoln Public Schools will use Character Counts! in their schools this year as will Bennet Elementary and North American Martyrs. Please contact LaDrane at 441-7180 if you would like additional information about Character Counts! workshops or other activities. (LJ)
I’m interested in 4-H!

Return to University of Nebraska Cooperative Extension in Lancaster County, 444 Cherry Creek Road, Lincoln, NE 68528-1507.

Issued in furtherance of Cooperative Extension work, Acts of May 8 and June 30, 1914, in cooperation with the U.S. Department of Agriculture. University of Nebraska Cooperative Extension educational programs abide with the nondiscrimination policies of the University of Nebraska-Lincoln and the United States Department of Agriculture.

The Lancaster County Citizen Washington Focus group has three open seats for their journey to Washington, D.C., in June of 1999. CWF is a leadership program for high school youth from across the country. Every summer thousands of youth stay at the National 4-H Center, near Washington, D.C., to participate in this week-long program. We are planning to leave June 13 and return June 28. We are taking a charter bus so we can sight see all the way there and all the way back. For more information or for seat reservations, please give Deanna a call at 441-7180. (DK)

1999 CWF members wanted

The 1998 State 4-H Horse Expo was held at Fonner Park in Grand Island, July 12-16. There were a total of 667 exhibitors with 1139 horses and 2164 entries from across the state. Lancaster County was represented by 45 exhibitors with 120 entries. Congratulations to all who made it to state and participated in the show.

Following are the results of the show. Purple ribbons were awarded to: Rachel Braunroth (Reserve Champion, Elementary Dressage), Liz Judels (Showmanship), Sara Messick (English Pleasure and Trail Horse), Megan Miller (Western Horsemanship), Teresa Perrin (Elementary Dressage), Danae Peterson (Western Pleasure), Amy Ryan (Western Horsemanship, 1st Place), Kyle Ryan (Western Pleasure and Western Horsemanship, ranked 10th), Katie Saltslard (Western Horsemanship, ranked 8th), Lindsay Schoneweis (Western Pleasure and Barrel Racing, top ranked), Andrea Winner (Western Pleasure), Jason Wise (Showmanship, Western Pleasure, Trail Horse and Halter, Reserve Champion) and Kim Zalewski (Showmanship and English Horsemanship).

Blue ribbons were given to: Josh Blum (Western Pleasure, Western Horsemanship and Barrel Racing), Rachel Braunroth (Trail Horse and Halter), Kevin Hajek (Western Pleasure), Liz Judels (English Pleasure, Western Horsemanship), Chelsea Leatherwood (Barrel Racing), Sara Messick (Western Horsemanship and Halter), Megan Miller (Showmanship and Western Pleasure), Sara Morrisrey (Roping), Ashley Murray (Showmanship and English Horsemanship), Lindsay Schoneweis (Western Horsemanship), Nicole Steinhauer (Western Pleasure), Andrea Wanner and Brandi Wynegar (Western Horsemanship) and Kim Zalewski (English Pleasure).

Lancaster County had Horse Bowl, Horse Judging and Senior Hippology teams coached by Brenda Messick. Blue ribbons were won by the teams in each of these contests.

It was a great show. (EK)

**NatureLink, an outdoor education weekend for families**

NatureLink, a family oriented outdoor education program will be held at the Nebraska State 4-H Camp at Halsey September 25-27. The focus of the NatureLink weekend will be on learning about the outdoors. Participants will attend learnshops on outdoor skills, canoeing, forest/pond/river studies and nature awareness. Previous experience or knowledge in these areas is not required—the sponsors welcome novices who want to learn and have fun in the process.

NatureLink offers a tremendous opportunity for a family to get out to the Nebraska National Forest and learn about a variety of outdoor topics. Your family will receive hands-on experience, gain a large amount of knowledge and learn some valuable ideas on how we can conserve and enjoy the earth’s natural resources.

Registration deadline is September 1. Program fee is $80 per person and children 7 and under are free. Fee includes program materials, lodging, meals.

To register, or for more information, contact Lorene at 441-7180. (LB)

---

**County fair was a success!**

Thanks to all the fair volunteers, parents, 4-H leaders, 4-H members, 4-H Ambassadors and Teen Council members for a job well done. We couldn’t have a fair without you. A special thanks goes to the Fair Board and 4-H Council members for their support of the 4-H program. Also thanks to Gerri Ault and crew for keeping the Rock Cafe and Snack Shack running.

Thanks again! (LB)
Mark your calendars for National Pollution Prevention (P2) Week

September 21-27, 1998

Pollution Prevention Week (P2 Week) began in 1992 in California at the local grass roots level. The third week of September was designated as Pollution Prevention Week by local government officials and organization heads throughout California to promote and highlight pollution prevention (P2) efforts. Since then, celebration of this week has spread throughout the country. In 1995, the event moved to the national level and has continued to grow.

P2 Week has become a valuable opportunity for government agencies, business groups, and community organizations to work together to highlight the importance of pollution prevention. The week provides a chance to publicize year-long P2 efforts.

P2 Week is also a time when businesses, government, environmental groups and citizens can join forces for a common cause. By sharing information about P2, businesses can become more competitive, business and government can realize cost savings and environmental quality can be enhanced.

...just what is pollution prevention?

Pollution is the contamination of air, soil, and/or water by the discharge of harmful substances. Pollution prevention is the reduction/elimination of pollution at the source, instead of at the end-of-the-pipe or stack. Pollution prevention occurs when raw materials, water, energy and other resources are utilized more efficiently. For example less harmful substances are substituted for hazardous ones, and toxic substances are eliminated from the production process. By reducing the use and production of hazardous substances, and by operating more efficiently, we protect human health, strengthen our economic well-being, and preserve the environment.

Source reduction allows for the greatest and quickest improvements in environmental protection by avoiding the generation of waste and harmful emissions. It makes the regulatory system more efficient by reducing the need for end-of-the-pipe environmental control by government.

Adopting pollution prevention practices and techniques often benefits industry by lowering a company’s operational and environmental compliance costs. By preventing the generation of waste, P2 also can reduce or eliminate long-term liabilities and clean-up costs.

Furthermore, disposal costs are reduced when the volume of waste is decreased. This also can lead to a reduction in workplace exposures to hazardous materials which can affect workers’ health and hence productivity. If less waste is produced, there will be a diminished need for on-site storage space. By preventing pollution, there will be a greater likelihood that a company may be in compliance with local, state, and federal compliance statutes.

Finally, businesses should an important responsibility for protecting the environment and natural resources for their own good and that of society. So, as P2 Week rolls around, plan an event that will show off your organization’s activities.

Ideas for businesses and industry might include:

- Distribute promotional materials of your current activities.
- Distribute industry-specific P2 fact sheets.
- Organize a “clean shop” tour.
- Host a brown bag lunch or breakfast seminar on P2.
- Organize a contest to reward employees for developing P2 ideas.
- Tell other businesses about your P2 activities.
- Evaluate existing waste practices and P2 options.
- Watch for growth opportunities in which you can participate.

For more information, contact Phil Rooney, Lincoln-Lancaster County Health Department at 441-8644. (Resource: National Pollution Prevention Roundtable) (ALH)

Identifying suspicious activity

Not every stranger who comes into your neighborhood is a criminal by any means. There are many door-to-door salesmen, repairmen, and servicemen moving around our neighborhoods all the time, but criminals do take advantage of this by pretending to be legitimate workers. The Sheriff’s Office would rather investigate than be called when it is too late. Your call could save a life, prevent an injury, or stop a criminal act. Be alert. Be concerned and call.

Suspicous Activity Concerning Persons

<table>
<thead>
<tr>
<th>Circumstances</th>
<th>Possible Crime</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vehicle moving slowly, without lights or driving in an aimless manner. This is suspicious in any location, including residential areas, schools and playgrounds.</td>
<td>Possible burglary, drug pusher or sex offender.</td>
</tr>
<tr>
<td>Person sitting or walking alone in a secluded area.</td>
<td>Possible rape or assault.</td>
</tr>
<tr>
<td>Person looking around a car or going car to car parking lot, especially females.</td>
<td>Possible rape or assault.</td>
</tr>
<tr>
<td>Person offering items for sale at a very low price.</td>
<td>Possible sex offenders or drug activity.</td>
</tr>
<tr>
<td>Stranger looking at an occupied vehicle while you or others are outside.</td>
<td>Possible burglary suspect.</td>
</tr>
</tbody>
</table>

Prevent crime the pro-active way: organize a Neighborhood Watch Program

Neighborhood watch is a program to help residents protect themselves and their property. It is not a program of vigilante actions nor does it use citizens to actually enforce the laws. It is about establishing a network of eyes and ears for the Lancaster County Sheriff’s Department. Through a system of training and organizing neighborhoods, citizens become alert to suspicious activity and take an active role in reducing crime.

Organizing a Neighborhood Watch

1. Visit with friends and neighbors to determine their interest and support for a Neighborhood Watch Program.
2. Contact the Crime Prevention Division of the Lancaster County Sheriff’s Department (Deputy Emanuel Bartee, 441-7727) to organize a meeting (non-emergency phone number 441-6500).
3. Determine an organizational meeting date and time.
   Usually these meetings are held at the home of the organizer.
4. During the meeting, the Lancaster County Sheriff’s Department will provide:
   • A deputy to explain the Neighborhood Watch Program and answer questions.
   • Assistance in selecting a coordinator for your area—usually the person who organizes a meeting.
   (A color TV should be available for use during the meeting.)
5. If an easily defined area exists for a Neighborhood Watch Program to operate, the Sheriff’s Department will post Neighborhood Watch signs. An area map of people from the neighborhood should be supplied.
6. The services of a Neighborhood Watch:
   1. During the organizational meeting, the Lancaster County Sheriff’s Department will compile a list of participants and distribute additional information to all members in the watch area.
   2. Once all guidelines are met, Neighborhood Watch signs will be posted.
   3. When the Lancaster County Sheriff’s Department has information pertinent to your neighborhood watch area, the coordinator will be notified. The coordinator will forward the information on to neighborhood watch members. (i.e., a certain car or person to watch for, etc.)
   4. If a neighborhood watch member has something to report, they will contact the Sheriff’s Department directly.
   5. Newsletters from the Sheriff’s Department are distributed through the neighborhood watch coordinator to the members.
6. Neighborhood Watch groups can organize various networks of communication between members as deemed necessary. (GB)
Harvesting everlasting flowers for drying

the base of wreaths. Harvest the stems when the pebbly seed head is fully developed.

Lavender (Lavandula angustifolia) - Pick stems when the florets on spike are opening. Hang upside down to dry.

Feverfew (Chrysanthemum parthenium) - Stocky green stems when the pebbly seed heads are grey-blue and before the tiny flowers appear. Pick when about 1/2 to 2/3 of the flowers are open. Hang upside down to dry.

Globe Thistle (Echinops ritro) - Pick as soon as the central globes are grey-blue and before the tiny flowers appear. Dry upside down.

Lavender Blazing Star (Liatris spicata) - Pick when 1/2 to 2/3 of the flowers are open. Hang upside down to dry.

Money Plant (Lunaria annua) - This biennial has lavender or white flowers and creates its unique seed pods the second year. Pick when the plant dies back. When dry, the pod covers come off easily to reveal the translucent discs.

Control of ground ivy...

Control of ground ivy... Continued from page 2

materials will selectively kill the ground ivy, but not harm the turfgrass. Products which contain 2,4-D are effective on ground ivy. To achieve control, make two or three applications in the fall. Fall applications are generally more effective than spring applications. Also, there is lower risk of injury to desirable garden plants from herbicide drift with fall applications. The first application can be made in mid September, a second in early October. When using pesticides, read and follow label directions carefully.

Home owners that have Kentucky bluegrass have another option. They can use a mixture of three teaspoons of Borax and one gallon of warm water. Two or three applications may be needed. This mixture should be applied to bluegrass lawns only.

Once the ground ivy has been effectively controlled, the homeowner needs to use good mowing, fertilization, watering and cultivation practices to obtain a dense, healthy, competitive stand of turfgrass which should help prevent future weed infestations (MIM).

What is LB1209 and does it affect you?

What is LB1209 and does it affect you? Continued from page 4

will be notified and given an opportunity to comment on the application. Public notice will also be given on large (Class III and Class IV) operations presumably so people can make their concerns known to appropriate authorities.

Permit requirements include the design (by a licensed professional engineer, in most cases) of the actual livestock waste control facility, initial and annual inspection by appropriate agencies, and the development of a plan, approved by the NRD, for the disposal of the livestock waste which may include testing the soil for phosphorus content before application of waste and ground water monitoring in some cases. Reviewed by David Aiken, Extension Water Law Specialist, UNL. (TD)

Allergic to bee stings?

Fresh, fabulous and safe—fruits and vegetables!

Fresh, fabulous and safe—fruits and vegetables! continued from page 6

information. This is most frequently found on precut items.

• Throw away fruits or vegetables that have been stored too long and smell bad, are moldy or slimy.

• For more specific information on how long to store produce, check with the produce manager at your favorite grocery store or call the cooperative extension office.

Washing

Washing

 Rinse whole produce thoroughly under clean running tap water just before you use it—not when you store the item or items. Rub as needed to help remove surface contamination. Before washing, discard the outer leaves of leafy vegetables such as lettuce and cabbage.

Wash fruits and vegetables (such as oranges and melons) even if you don’t eat the rind or skin. When you cut into a fruit or vegetable, any bacteria that is on the outer surface can be transferred to the inner flesh.

Do not wash fruits and vegetables with detergent. Fruits and vegetables can absorb the detergent. Detergent is not intended for use on foods and can make you sick.

Handling Cut Produce

Handling Cut Produce

Store all cut fruits and vegetables covered, in containers, in the refrigerator. Once produce is cut, any microorganisms that get on the cut surface can start to grow.

Store fresh-cut produce above raw meat, poultry and fish and below cooked items. Generally, quality is best if you use cut produce within a day.

Note: The flesh of some fruits—such as apples, bananas, nectarines and peaches—turns brown when the fruits are peeled or cut and exposed to air. To prevent this darkening, coat their surface with a citrus juice such as lemon, orange, grapefruit or lime juice.

The PMA recommends you discard cut produce that has been out of the refrigerator for more than four hours. These four hours include preparation, transport and serving time.

Preparing

Preparing

Use clean hands, utensils and a cutting board when working with fresh produce. Especially avoid touching raw meat, poultry and seafood before handling fresh fruits and vegetables.

Before working with fresh produce, wet your hands with warm water, apply soap and rub your hands together for 20 seconds. Rinse thoroughly and dry them with a clean towel.

Use a plastic or other non-porous cutting board; keep it clean by running it through the dishwasher after each use or by washing it with hot soapy water, followed by rinsing with hot water and air drying.

At events such as buffets where food is set out for guests, avoid adding fresh fruits and vegetables to foods that have been set out. Instead, serve smaller trays of food and set out fresh foods as needed. Keep cut produce in the refrigerator until just before serving; follow the storage recommendations given earlier.

Remember the guideline for discarding cut produce that has been out of the refrigerator more than four hours (and remember—the four hours includes your TOTAL preparation, transport and serving time).

**4-H School Enrichment in the classroom**

Making recycled paper—hatching baby chicks! Or learning about space and water quality! Your youngster may be taking part in 4-H School Enrichment. Yearly, approximately 12,000 students in Lancaster County classrooms participate in this exciting, science-based program. Through creative, hands-on activities, youth learn exciting things about the world around them.

4-H School Enrichment encourages second graders to reduce, reuse and recycle. Sorting garbage, discovering types of packaging and making recycled paper are just a few of the activities in this unit.

The miracle of life unfolds in Embryology as third graders study life cycles. Students and teachers are responsible for the care of fertile eggs throughout the 21-day incubation period, then...baby chicks are hatched right in the classroom.

Blue Sky Below My Feet relates science and space technology to daily living for fourth graders. By using features from the space shuttle program as working models, students learn how forces, fibers and food affect their lives on earth and astronauts while in space.

With an emphasis on quantity and quality, 4-H Water Recycling keeps our earth healthy. (ALH)

**Calling All Artists!**

**1999 White House Easter Egg Artistry Contest**

The 1999 White House Easter Egg Artistry Contest is underway! The American Egg Board (AEB), in conjunction with the Poultry & Egg Division of the Nebraska Department of Agriculture, is again sponsoring this statewide contest.

The winning egg chosen from the state of Nebraska will be sent to the American Egg Board (AEB) for inclusion in the 1999 Easter Egg Display at the White House in Washington, D.C. The deadline is September 3, 1998. For contest criteria or further information, contact Mary Reiners by E-mail: mreiners@unlinfo.unl.edu or call 402-472-0752.

**Recycling facts**

The Steel Recycling Institute (SRI) reports that the steel can recycling rate reached 60.7 percent for 1997, with more than 1.7 million tons of packaging recycled. That’s the equivalent of about 633 cans recycled per second for an entire year.

More than 46 million cars were recovered and nearly 13 million cars were recycled in 1997. Comparing the number of automobiles taken off the road to the number of new cars produced shows an automobile recycling rate of 97.6.

With the growing awareness of recycling steel from construction and demolition sites, the rates have continued to grow. In 1997, it is estimated that more than 40 percent of the terbar and more than 90 percent of the steel plates, bars and structural products were collected for recycling. Source: SRI Update (ALH)
