This Article is brought to you for free and open access by the Nebraska Ornithologists' Union at DigitalCommons@University of Nebraska - Lincoln. It has been accepted for inclusion in Nebraska Bird Review by an authorized administrator of DigitalCommons@University of Nebraska - Lincoln.
This Yellow-throated Warbler was photographed by B.J. Rose at a suet feeder at the home of Jackie Halterman, 1921 S. 113th Ave., Omaha. The bird was present from 28 November to 24 December 1980. It had a regular feeding pattern, which included at least 3 feeders in neighboring yards. It came to the suet feeder at Mrs. Halterman's from 6 to 10 times each day.

LEWIS' WOODPECKERS IN WESTERN NEBRASKA

On 30 August 1980, Dr. Randy Lawson from Chadron State College reported to me that Lewis' Woodpeckers (Asyndesmus lewis) were in a dead elm tree about eight miles south of Chadron on the west side of U.S. Highway 385. We observed them for about an hour, and in the afternoon, Marj Blinde and I watched them for about an hour more. They numbered at least 12 and flew from the elm to fence posts and telephone posts nearby.

They performed the flycatching actions for which they are noted, but it seemed the attraction of this particular location was a chokecherry thicket about 100 yards west of the tree. The tree stood at the edge of another chokecherry thicket, but every time we saw them fly to chokecherries, they went to the farther one.

We sat on a hill close to them and could see them pick the cherries, some of which they swallowed, some they carried back to the dead elm, and in a few instances, we could see them go to fence posts, where they seemed to examine all the cracks and later they went back to the tree with nothing in their beaks.

Examination of the posts disclosed in one post five cherries in cracks that measured just one cherry wide. In two cracks were two cherries, and a single one was in another.
