Proprietary research to determine feasibility of commercializing
the Pink Oyster Mushroom

Evan P. Bumann

AN UNDERGRADUATE THESIS

Presented to the Faculty of

The Environmental Studies Program at the University of Nebraska-Lincoln

In Partial Fulfillment of Requirements for the Degree of Bachelor of Science

Major: Environmental Studies

With the Emphasis of: Natural Resources

Under the Supervision of Dr. Charles A Francis

With Additional Assistance from:

Greg Bumann

Janet D. Wright

Dr. Richard A Wilson

Lincoln, Nebraska

ABSTRACT

This project serves as a feasibility experiment to bring the Pink Oyster mushroom (*Pleurotus flabellatus*) into constant domestic cultivation for the purposes of commercialization. Important data acquired from growth trials were growth timelines and yields. This information was used to generate interactive spreadsheets with which one can determine possible cost and profit in a variety of scenarios. The first portion of the experiment involved constructing a growth chamber, which can achieve and maintain stable environmental conditions. This portion was successful. Secondly, the numbers obtained from the experimental growth trials were used to determine future projections from the perspective of a small business start up. According to the data, investment in production is expected to be highly lucrative, with a projected net profit margin range of 300-2000%

INTRODUCTION AND LITERATURE REVIEW

P. flabellatus is a species of the edible higher fungi and supposedly originates from Malaysia. It is aggressive, saprophytic and thrives in tropical climates. Due to its aggressive nature, the fungus is an excellent candidate for processing a wide variety of substratesⁱ into a healthy, edible food product. Additionally, the processed substrate makes nutritious fodder for ruminant livestock and can be used as a horticultural and agricultural additive for improving nutrient availability and quality in soils. Other uses for the *Pleurotus* fungus include bioremediation^{ii,iii}, replacing foam in packaging, car parts, etc...^{iv}, and includes, but is not limited to, potential relevance to the medical industry^v.

Pleurotus mushrooms in general are highly nutritious (Table 4, “nutrition information”, obtained from Nutritiondata.self.com^{vi}). The fruit body produced by the *P. flabellatus* fungus is referred to as the “Pink Oyster Mushroom” and is widely desired by culinary artists and everyday consumers alike. The pink oyster mushroom carries a strong flavor, which compliments red meats and seafood nicely. Additionally, it is not readily available in Nebraska, nor surrounding areas, as it cannot persist in sub-tropical climates outside of domestic cultivation. The goal of this project became an experiment in

feasibility to bring the pink oyster mushroom into regular, constant production for sale in southeast Nebraska and surrounding areas.

Commercial mushroom cultivation is a big industry using age-old techniques, which have proven effective time and time again. Simply explained, substrate (in this case, wheat straw hay) is hydrated and pasteurized, then inoculated with spawn (in this case, colonized sorghum grain). This is followed by an incubation/colonization period, and lastly fruiting/harvest. Of course, techniques differ among types and strains^{vii,viii,ix}.

Most commercial operations take place in a somewhat sterile, climate-controlled environment. *Pleurotus* mushrooms are no different. While some types of mushrooms use stacked trays and pasteurized soil or logs in the cultivation protocol, *Pleurotus* mushrooms are often cultivated in hanging plastic bags packed full of spawn and substrate, which vary in size and orientation.

PROJECT GOALS

1. Design and build a self-contained environment to cultivate (tropical) mushrooms with minimal maintenance which mimics a scaled-down commercial facility
2. Determine feasibility, cost, and returns associated with expansion for continuous production and sale using information obtained from the constructed environment

MATERIALS

- Incubation unit
 - 22.5 cu foot refrigerator with top mounted freezer
 - Zoomed Hygrotherm
 - Zoomed ultrasonic humidifier
 - Schedule 80 PVC, 2", 8 ft
 - 10 ft furnace tape
 - Plastic/acrylic sheet (condensation leakage preventer)
 - Sheet metal (3ftx3ft)
 - Self-tapping screws (10)
 - 12 feet rope lights
 - Light switch (2)

- 30 gallon aquarium pump
 - Aquarium tubing, 2 feet
- Sorghum grain (one bag, 50 lb)
- Wheat straw hay (one bale, 75 lb)
- Plastic bags
- Half-gallon size mason jars (1 package)
- Fiber-fill pillow stuffing (1 bag)
- Fungus tissue culture
 - *Pleurotus flabellatus*
- Sterilization equipment
 - University autoclave

METHODS

- Fungal tissue culture purchased from commercial distributor
 - Propagated to agar ('complete media')
 - Culture maintenance
 - Propagated to grain spawn, 1-2 cc/jar
 - **One 4-inch petri plate can be overtaken in 4-8 days**
- Spawn jars
 - One quart, half-gallon mason jars
 - 3/4" diameter hole drilled into lid
 - Pack in wad of fiber-fill (filter)
- Grain spawn
 - Hydrated, sterilized sorghum grain
 - Soaked for four to ten hours, rinsed
 - Boiled for ~ten minutes to burst testa
 - Drained, cooled
 - Fill to spawn jars 2/3 full
 - Sterilize: autoclave on "gravity" setting for 90 minutes
- Incubate grain spawn until fully colonized

- Set incubator temperature to 82 degrees F
 - Set incubator relative humidity to 95%
 - **Colonization of grain spawn takes 6-11 days**
- Wheat straw hay preparation
 - Chop straw to 4-8", hydrate overnight.
 - Fill straw into large stock pot with water
 - Bring water to boil
 - Remove heat, leave covered until cool.
 - Let water drain
- Create "straw logs"
 - Transfer colonized grain spawn and hydrated, pasteurized wheat straw hay (substrate) to plastic bag (mix spawn through whole substrate)
 - Use about 1 quart jar for 1.5 cu ft of hydrated straw, packed into bag
 - Poke ~1/4" holes all around bag, approx 6" grid
- Incubate straw logs
 - Set incubator temperature to 85 degrees F
 - Set incubator relative humidity to 95%
 - **Colonization takes approximately 8-10 days**
- Initiate fruiting conditions
 - Turn on lights
 - Set incubator temperature to 75 degrees F
 - Set incubator relative humidity to 85%
 - Make sure CO2 pump is operational
 - **Fruiting takes 5-8 days for mushrooms to grow and mature**

Data analysis is performed through spreadsheet tables. Under "Results and Discussion" are the tables with explanations of how to read and use them, and the equations used to populate many of the fields.

RESULTS

The first goal was to design a self-contained environment to cultivate (tropical) mushrooms with minimal maintenance. The grow unit is suitable for nearly all domesticated mushrooms, but specifically designed to accommodate tropical species. This portion of my project was successful. The grow unit (referred to as the “incubator”) holds temperature at +/- 3 degrees F of the set parameter and relative humidity at +/- 3% of the set parameter. Climactic factors can be and are adjusted throughout the grow cycle. Lights can be turned on or off externally. Additionally, there is a setting for day and night cycles if necessary. Interior design of the incubator accommodates a wide variety of cultivation techniques. A cost sheet for the incubator and supplies can be found as “Table 1”.

Trials yielded a weight range of approximately 1.5-2.5 lbs of fresh mushrooms in a 4-week time period from micro propagation to fruit harvest, within 10 cubic feet of used space.

The second goal was to use the growth data to determine a timeline for consistent production and sale from a small business start-up perspective.

To determine cost and profit, the researcher has designed multiple spreadsheet tables which are successively linked. Therefore, with just a few changes to specific fields (red cells and cells bordered in red), numbers are generated across all tables. First to be observed is **Table X, “Incubator” definition**. This is the first table to be populated. This table defines factored parameters of the variable “Incubator”. It is based in part on the **Linked References Table** shown after, which is shown populated with numbers from the feasibility project. It should be noted that the numbers could easily be re-worked to change the definition of the variable “Incubator”.

Based on the number of incubation units used, amt.needed/cycle is generated. These numbers are linked through the rest of the tables. Color-coding is used to illustrate which table portions are linked. Expansion and crop scenarios using the following tables can be found in the “discussion and analysis” section.

Table X, "Incubator" Definition				
Total number incubators:	10			"Incubator" cost
				\$100.00
Item	One Incubator	Total incubators	Amt. needed/cycle	Units
cu ft usable space	10	100	-	cu ft space
length of HDPE tube	10	100	0.036	rolls
(lbs) dry hay per cycle	10	100	0.1	bales
(lbs) dry grain per cycle	5	50	1	bag
grain jars per cycle	5	50	5.56	pkgs
pillow stuffing	5	50	0.5	pkgs

Equations

- Incubator cost: cost of one incubator
- Total Incubators: (One incubator)*(Number of incubators)
- Amt. Needed HDPE tube/cycle: (Total incubators)/(usable ft tubing)
- Amt. Needed hay bales/cycle: (Total incubators)/(Weight of hay bale)
- Amt. Dry grain/cycle: (Total incubators)/(Weight 1 bag grain)
- Grain jars/cycle: (Total incubators)/(Grain jars in package)
- Pillow stuffing: (Total incubators)/(Jars per bag stuffing)

Second is the linked reference table. It contains values linked to calculations in the rest of the analysis tables:

Linked Reference Table		
Item	Variable	Cost
number incubators owned	0	-\$100.00
incubator unit	1	\$100.00
weight 1 hay bale (lbs)	1600	\$75.00
weight 1 bag grain (lbs)	50	\$16.00
2 mil HDPE tubing, 3000 ft, 12" dia. (usable:)	2800	\$113.00
heat sealer	1	\$60.00
grain jars in pkg	9	\$9.00
jars/bag stuffing	100	\$8.00
weeks per cycle	4	☺
growing weeks per year	48	☺
est. overhead cost/incubator/cycle	☺	\$1.00
Yield, lbs/incubator	2.1	☺
value/lb (1)	☺	\$10.00
value/lb (2)	☺	\$12.00
value/lb (3)	☺	\$15.00
value/lb (4)	☺	\$20.00

Equations

- None are used, but “est. overhead cost/incubator/cycle” is linked to the **total (cycle)** on the Overhead Sheet, seen below and color coded appropriately.

Labor and other costs are not figured at this point, but can easily be populated into the overhead sheet

overhead sheet		
	cost/cycle	cost/year
electricity	\$1.00	\$16.00
-		
-		
total	\$1.00	\$16.00

Next is the expansion scenario calculator. As color-coding will indicate, it is directly linked to and mostly populated by the previous tables to generate a supplies cost,

which populates fields showing cycles and timelines until the materials are theoretically paid for.

Expansion scenario calculator					
Item	Cost per	Multiplier	Total		
incubation space owned	-\$100.00	0	\$ -		
incubation space expansion final	\$100.00	10	\$ 1,000.00	AKA Facilities purchase cost or purchase cost per (10) cubic feet of used grow space	
grain jars 0.5 gal	\$1.00	50	\$ 50.00		
pillow stuffing	\$8.00	1	\$ 8.00		
sorghum grain, bag	\$16.00	1	\$ 16.00		
wheat straw hay, bale	\$75.00	0.1	\$ 4.69		
overhead/ incubator/ cycle	\$1.00	10.00	\$ 10.00		
2 mil HDPE tubing, 3000 ft, 12" dia.	\$113.00	1	\$ 113.00		
		total 1	\$ 1,261.69		
yield/incubator (lbs)	value/lb	crop value, total	cycles to profit	weeks to profit	months to profit
2.1	\$10.00	\$210.00	6.0	24.0	6.0
	\$12.00	\$252.00	5.0	20.0	5.0
	\$15.00	\$315.00	4.0	16.0	4.0
	\$20.00	\$420.00	3.0	12.0	3.0

Equations

- Cost per grain jar: (Cost of grain jar package)/(Number of jars in package)
- Total 1: sum of product input costs
 - May be figured with the addition of price of heat sealer
- Cycles to profit: (Total 1)/(Crop value, total)
- Weeks to profit: (Cycles to profit)*(Weeks per cycle)
- Months to profit: (Cycles to profit)*(Weeks per cycle/4)

Next is the crop cost and profit calculator (1). This calculator is somewhat less dependent on other tables, specifically the expansion scenario, but still linked. This table is to be referenced after the expansion scenario, and once all reusable supplies are paid for. Reusable equipment totals are for reference only; they are not referenced by any other calculation. They are not figured in due to inconsistent longevity.

Crop cost and profit calculator (1)							
number incubators:	10						
non-reusable equipment							
item	one incubator	total incubation space	amt. needed/cycle	units	bulk cost /cycle	actual cost/cycle	actual cost/year
cu ft usable space	10	100	100	cu ft space	-	-	-

Yield, lbs/incubator	total yield/cycle (lbs)/incubator	total yield/year (lbs)/incubator		cyclic materials cost per cu ft			
2.1	21.0	252.0			\$ 0.35		
				yearly materials cost per cu ft	\$ 4.17		
Yield, lbs/incubator	value \$/lb	crop value	yearly crop weight (lbs)	crop value per cu ft	net profit /cu ft/cycle	gross profit/cu ft /year	net profit/cu ft/year
2.1	\$10.00	\$ 210.00	252	\$ 2.10	\$ 1.75	\$ 25.20	\$ 21.03
	\$12.00	\$ 252.00	252	\$ 2.52	\$ 2.17	\$ 30.24	\$ 26.07
	\$15.00	\$ 315.00	252	\$ 3.15	\$ 2.80	\$ 37.80	\$ 33.63
	\$20.00	\$ 420.00	252	\$ 4.20	\$ 3.85	\$ 50.40	\$ 46.23

Equations

- Cycles per year: (Weeks per year)/(Weeks per cycle)
 - Weeks per year is total number of weeks in a year used to grow (“Growing weeks per year” in the linked reference table).
- Actual product cost per year: (Actual cost/cycle)*(Cycles/ year)
- Profit/cycle w/ bulk cost: (Crop value)-(Bulk cost/cycle)
- Net profit per cycle: (Crop value/lb)-(Actual cost/cycle)
- Gross production value/year: (Crop value)*(Cycles per year)
- Net Profit/year: [(Net profit/cycle)*(Cycles per year)]-(Actual product cost/year)
- Profit percentage: [(Net profit per year)/(Actual product cost per year)] x100%
- Total yield/cycle: (Yield/incubator (lbs))*(Number incubators)
- Total yield/year (lbs): (Total yield/cycle)*(Number cycles per year)

- Cyclic materials cost per cu ft: (Actual cost/cycle)/(Cu ft usable space)
- Yearly materials cost per cu ft: (Cyclic cost per cu ft)*(Cycles/year)
- Crop value per cu ft: (Crop value)/(Cu ft usable space)
- Net profit per cu ft per cycle: (Net profit/cycle)/(Cu ft usable space)
- Gross profit per cu ft/year: (Crop value per cu ft)*(Cycles/year)
- Net profit per cu ft/year: (Net profit/cu ft/cycle)*(Cycles/year)

Lastly, we have the data output table. This is a condensed summary of some key factors generated through the tables for easy analysis:

DATA OUTPUT SUMMARY	
Yield/10 cu ft (lbs)	2
cu ft 1 incubator	10
Value (\$/lb)	\$20.00
Weeks per cycle	3
Weeks per year	50
Cycles per year	16.7
=	
Investment cost	\$ 8,459.99
Total Crop Weight (lbs)	1,933.33
Cycles until profit	4.0
Months to profit	6.0
Net profit/year	\$ 35,986.93
Purchasable space (incubators) w/ recycled profits	3599

To look at expansion scenarios, we use the Expansion scenario calculator. It is designed similarly to the above cost and profit calculator (1), with a few modifications:

cost/turnaround calculator				
Table X, "Incubator" Definition				
total number incubators:	10	"=x10 cu ft space"	"incubator" cost	
			\$125.00	
item	one incubator	all incubators	amt. needed/cycle	units
cu ft usable space	10	100	-	cu ft space
length of HDPE tube	10	100	0.036	rolls
(lbs) dry hay per cycle	10	100	0.1	bales
(lbs) dry grain per cycle	5	50	1	bag
grain jars per cycle	5	50	5.56	pkgs
pillow stuffing	5	50	0.5	pkgs
linked reference table			Scenario values	
item	variable	cost	year #	recycled profit %
number incubators owned	1	-\$125.00	1	100.00%
incubator unit	1	\$125.00	2	100.00%

weight 1 bag grain (lbs)	50	\$16.00	4	75.00%
2 mil HDPE tubing, 3000 ft, 12" dia.	2800	\$113.00	5	75.00%
heat sealer	1	\$60.00	6	50.00%
grain jars in pkg	9	\$9.00	7	50.00%
jars/bag stuffing	100	\$8.00	8	50.00%
weeks per cycle	3	☺	9	50.00%
growing weeks per year	48	☺	10	0.00%
est. overhead cost/10 cu ft useable space/cycle	☺	\$1.00		
Yield, lbs/10 cu ft/cycle	1.5	☺		
value/ (lb)	1	\$12.00		

Equations

- All equations used are the same as the cost and profit calculator (1)

The major difference to be noted at this point is the table labeled "Scenario Values". This table is where values for recycled profits (for the purpose of purchasing more usable grow space) are figured for the year's end (next year's beginning).

Following, we see the expansion scenario calculator. This table is to be used in conjunction with the Table X, definition of Incubator. These numbers are fed in to the Expansion Scenario calculator, which we have seen before:

				Timeline:	Begin Year #	1	Below
Expansion scenario calculator							
item	cost per	multiplier	total				
incubation space owned	-\$125.00	1	\$ (125.00)				
incubation space expansion							
final	\$125.00	10	\$ 1,250.00	AKA Facilities purchase cost or purchase cost per (10) cubic feet of used grow space			
grain jars 0.5 gal	\$1.00	50	\$ 50.00				
pillow stuffing	\$8.00	1	\$ 8.00				
sorghum grain, bag	\$16.00	1	\$ 16.00				
wheat straw hay, bale	\$100.00	0.1	\$ 6.25				
overhead/ 10 cu ft/cycle	\$1.00	10.00	\$ 10.00				
2 mil HDPE tubing, 3000 ft, 12" dia.	\$113.00	1	\$ 113.00				
		total 1	\$ 1,388.25				
yield/incubator (lbs)	value/lb	crop value, total	cycles to profit	weeks to profit	months to profit		
1.5	\$12.00	\$180.00	7.7	23.1	5.8		
cycles until profit	8		Total Crop Weight (lbs)				
profitable cycles per year	8		240				
crop sale value /year	\$ 1,440.00						
recycled profits @ (%)	100.00%						
recycled profits @ (\$)	\$ -						
allows for purchase of (x10 cu ft uable grow space)	0						
totalling (x 10 cu ft grow space) to begin the next year	10						
"= #10 ft logs"	10						

What we have not seen before, however, is the output table towards the bottom. This table shows (most importantly) cycles to profit and profitable cycles per year. Using this information, combined with the recycled profit percentage, populates the next set of tables.

Equations

- Cycles until profit: (Cycles to profit), rounded up to the nearest whole number
- Profitable cycles per year: (Growing cycles per year)-(Cycles until profit)
- Crop sale profit value per year: (Profitable cycles/year)*(Crop value, Total)
- Recycled profits @ %: linked to the Scenario Values table
- Recycled profits @ \$: (Crop sale profit value per year)*(Recycled profit %)
- Purchasable grow space: (Recycled profit @ \$)/(Incubator cost), rounded down to nearest whole number
- # Incubators to begin the next year: (Purchasable incubators)+(Total incubators from previous year)
- =10 ft logs: **assuming one incubator equates to 10 cu ft grow space:** (Total incubators to begin next year)*(1)

Lastly, we have the Cost/Profit scenarios for the next 9 years (10 in total):

				Timeline: Begin Year # 2 Below			
Cost/Profit				Year# 2			
number incubators:	21	"=x10 cu ft space"					
non-reusable equipment							
item	one incubator	total incubation space	amt. needed/cycle	units	bulk cost	actual cost/cycle	actual cost/year
CU FT USABLE SPACE	10	210	210	cu ft space	-	-	-
length HDPE tube/cycle	10	210	0.075	rolls	\$ 113.00	\$ 8.48	\$ 135.60
(lbs) dry hay per cycle	10	210	0.1	bales	\$ 100.00	\$ 13.13	\$ 210.00
(lbs) dry grain per cycle	5	105	2.1	bag	\$ 48.00	\$ 33.60	\$ 537.60
overhead/10 cu ft usable space	\$ 1.00	\$ 21.00	\$ 21.00	-	\$ 21.00	\$ 21.00	\$ 336.00
				cost/cycle	\$ 282.00	\$ 76.20	\$ 1,219.20
reusable equipment							
grain jars per cycle	5	105	11.67	pkgs	\$ 108.00	\$ 11.67	
pillow stuffing	5	105	1.05	pkgs	\$ 16.00	\$ 8.40	
				cost	\$ 124.00	\$ 20.07	
	weeks/cycle	weeks/yr	cycles/year				
cycles per year	3	48	16.0	total product cost \$ 1,219.20			
Yield, (lbs)/incubator	1.5						
Yield, lbs/incubator	value \$/lb	crop value/cycle	profit/cycle w/ bulk cost	net profit/cycle	gross production value	total net profit	profit percentage
1.5	\$12.00	\$ 378.00	\$ 96.00	\$ 301.80	\$ 6,048.00	\$ 4,828.80	396.06%
Yield, lbs/incubator	total yield/cycle (lbs)/incubator	total yield/year (lbs)/incubator		cyclic materials cost per cu ft	\$ 0.36		
1.5	31.5	504.0		yearly materials cost per cu ft	\$ 5.81		
Yield, lbs/incubator	value \$/lb	crop value	Total Crop Weight (lbs)	crop value per cu ft	net profit /cu ft/cycle	total crop value/cu ft	total net profit/cu ft
1.5	\$12.00	\$ 378.00	504	\$ 1.80	\$ 1.44	\$ 28.80	\$ 22.99
Profitable Cycles per Year	16.0						
Net Profit per Year	\$ 4,828.80						
Recycled Profits @ (%)	100.00%						
Recycled profits @ (\$)	\$ 4,828.80						
Allows for Purchase of (x10 cu ft grow space)	38						
Totalling (x 10 cu ft grow space) to Begin the Next Year	59						
"= # 10-ft logs"/cycle	59						

This table (and those which follow after) look similar (and they are) with one slight difference, in that (profitable cycles per year) is directly linked to (Cycles/year). This scenario calculator assumes no down time for production space expansion and no product loss due to unforeseen circumstances. Since all expansion is paid for with previous year's profits, there is no need to adjust the number of profitable cycles per year. Expansion scenarios can be generated for up to ten years, though more may be added.

The information obtained from the expansion scenarios is compiled into a summary table for easy reference:

Expansion Summary table							
Year	Yearly overhead	Net product cost/year	Total Recycled Investment, Year End	Net Profit/Year	Net Profit/Year - Recycled Investment	Yearly profit margin	Total Production /Year (lbs)
1	\$ 1,616.00	\$ 11,035.50	\$ 24,750.00	\$ 24,750.00	\$ -		2,400
2	\$ 5,552.00	\$ 20,145.83	\$ 104,774.17	\$ 104,774.17	\$ -	520.08%	8,328

The experimental incubation unit

Colonizing grain spawn

Fruit bodies 3 days to harvest

Freshly harvested mushroom, still slightly immature

Mushrooms on uncased straw log

Freshly harvested mushrooms, ~1 cu ft used grow space

Fully mature mushroom, past harvest window

ANALYSIS AND DISCUSSION

For the purposes of analysis, input costs, crop cycles, recycled profits, and crop values are changed for the scenario at hand and do not use numbers exactly as derived from the initial feasibility project.

Scenario 1: immediate expansion from one to five incubators; 50 cubic feet of grow space used

Using small-scale parameters and an initial investment of \$1,264.33, we see the numbers below:

		Timeline:		Begin Year #	1	Below
Expansion scenario calculator						
item	cost per	multiplier	total	AKA Facilities purchase cost or purchase cost per (10) cubic feet of used grow space		
incubation space owned	-\$260.00	1	\$ (260.00)			
incubation space expansion final	\$260.00	5	\$ 1,300.00

Recycled profits @ (\$)	\$ -						
Allows for Purchase of (x10 cu ft grow space)	0						
Totalling (x 10 cu ft grow space) to Begin the Next Year	241						
"= # 10-ft logs"/cycle	241						

At the end of year four, we see a projected profit of \$99,985.16 per year.

Scenario 3: immediate expansion to medium-scale production, 1000 cu ft (100 x 10 ft “logs”)

The following scenario takes on a significant change to the input cost side of things and uses large-scale parameters; a 1600 lb round bale of hay costs approximately \$100, instead of a 75lb square bale costing \$8.00. Purchasing hay in this quantity is appropriate and cost effective for production at this scale. Incubation unit cost is changed from \$26.00/cu ft to \$10.00 per cubic foot, or, for the purposes of these tables, \$100.00 per incubator. The researcher feels this is a more relevant cost estimation from the scale perspective . At this scale, cultivation would take place in a larger, cheaper, less mobile, scaled-up version of the modified refrigeration unit. Sale prices is figured as wholesale at \$12.00/lb

With an initial calculated investment of \$11,000, we see the following numbers:

				Timeline:	Begin Year #	1	Below

FUTURE RESEARCH

- Rehydration tests^x
 - Rehydration of spent colonies in nutrient solution
 - Analysis: growth notes
- Alternative bulk substrate
 - Alfalfa hay, soybean meal
 - Analysis: nutrition profile analysis of mushroom tissue vs. nutrient content of substrate(s)
- Over-insertion of genes responsible for enzymes capable of breaking down Bakelite (polyphenolic resin) plastics
 - Analysis: possible?

CONCLUSIONS

The proprietary research generated numbers that showed more profit and shorter crop times than originally expected. The researcher feels the information obtained is substantial and reliable enough to seek investment and move forward with implementing the business plan. Additionally, the researcher plans to use knowledge and skills obtained through this research and apply it to future research projects and likely profitable economic ventures.
